

# Low Power, Low Noise Voltage References with Sink/Source Capability

## ADR360/ADR361/ADR363/ADR364/ADR365/ADR366

### FEATURES

Compact TSOT-23-5 packages

Low temperature coefficient

B grade: 9 ppm/°C

A grade: 25 ppm/°C

Initial accuracy

B grade: ±3 mV maximum

A grade: ±6 mV maximum

Ultralow output noise: 6.8 μV p-p (0.1 Hz to 10 Hz)

Low dropout: 300 mV

Low supply current: 190 μA, Maximum

No external capacitor required

Output current: +5 mA/−1 mA

Wide temperature range: −40°C to +125°C

### APPLICATIONS

Battery-powered instrumentations

Portable medical instrumentations

Data acquisition systems

Industrial process controls

Automotive

### PIN CONFIGURATION

Figure 1. 5-Lead TSOT (UJ Suffix)

Table 1.

Model	V <sub>OUT</sub> (V) <sup>1</sup>	Temperature Coefficient (ppm/°C)	Accuracy (mV)
ADR360B	2.048	9	±3
ADR360A	2.048	25	±6
ADR361B	2.5	9	±3
ADR361A	2.5	25	±6
ADR363B	3.0	9	±3
ADR363A	3.0	25	±6
ADR364B	4.096	9	±4
ADR364A	4.096	25	±8
ADR365B	5.0	9	±4
ADR365A	5.0	25	±8
ADR366B	3.3	9	±4
ADR366A	3.3	25	±8

<sup>1</sup> Contact Analog Devices, Inc. for other voltage options.

### GENERAL DESCRIPTION

The ADR360/ADR361/ADR363/ADR364/ADR365/ADR366 are precision 2.048 V, 2.5 V, 3.0 V, 4.096 V, 5.0 V, and 3.3 V band gap voltage references that feature low power, high precision in a tiny footprint. Using ADI's patented temperature drift curvature correction techniques, the ADR36x references achieve a low temperature drift of 9 ppm/°C in the TSOT package.

The ADR36x family of micropower, low dropout voltage references provides a stable output voltage from a minimum supply of 300 mV above the output. Their advanced design eliminates the need for external capacitors, which further reduces board space and system cost. The combination of low power operation, small size, and ease of use makes the ADR36x precision voltage references ideally suited for battery-operated applications.

## ABSOLUTE MAXIMUM RATINGS

@ 25°C, unless otherwise noted.

Table 8.

Parameter	Rating
Supply Voltage	18 V
Output Short-Circuit Duration to GND	
$V_{IN} < 15\text{ V}$	Indefinite
$V_{IN} > 15\text{ V}$	10 sec
Storage Temperature Range	-65°C to +125°C
Operating Temperature Range	-40°C to +125°C
Junction Temperature Range	-65°C to +125°C
Lead Temperature Range (Soldering, 60 sec)	300°C

Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

### THERMAL RESISTANCE

$\theta_{JA}$  is specified for the worst-case conditions, that is,  $\theta_{JA}$  is specified for device soldered in circuit board for surface-mount packages.

Table 9. Thermal Resistance

Package Type	$\theta_{JA}$	$\theta_{JC}$	Unit
TSOT-23-5 (UJ-5)	230	146	°C/W

### ESD CAUTION

ESD (electrostatic discharge) sensitive device. Electrostatic charges as high as 4000 V readily accumulate on the human body and test equipment and can discharge without detection. Although this product features proprietary ESD protection circuitry, permanent damage may occur on devices subjected to high energy electrostatic discharges. Therefore, proper ESD precautions are recommended to avoid performance degradation or loss of functionality.

## TERMINOLOGY

### Temperature Coefficient

The change of output voltage with respect to operating temperature changes normalized by the output voltage at 25°C. This parameter is expressed in ppm/°C and can be determined by

$$TCV_O[\text{ppm}/^\circ\text{C}] = \frac{V_O(T_2) - V_O(T_1)}{V_O(25^\circ\text{C}) \times (T_2 - T_1)} \times 10^6$$

where:

$$V_O(25^\circ\text{C}) = V_O \text{ at } 25^\circ\text{C}.$$

$$V_O(T_1) = V_O \text{ at Temperature 1.}$$

$$V_O(T_2) = V_O \text{ at Temperature 2.}$$

### Line Regulation

The change in output voltage due to a specified change in input voltage. This parameter accounts for the effects of self-heating. Line regulation is expressed in either percent per volt, parts-per-million per volt, or microvolts per volt change in input voltage.

### Load Regulation

The change in output voltage due to a specified change in load current. This parameter accounts for the effects of self-heating. Load regulation is expressed in either microvolts per milliampere, parts-per-million per milliampere, or ohms of dc output resistance.

### Long-Term Stability

Typical shift of output voltage at 25°C on a sample of parts subjected to a test of 1,000 hours at 25°C.

$$\Delta V_O = V_O(t_0) - V_O(t_1)$$

$$\Delta V_O[\text{ppm}] = \left( \frac{V_O(t_0) - V_O(t_1)}{V_O(t_0)} \times 10^6 \right)$$

where:

$$V_O(t_0) = V_O \text{ at } 25^\circ\text{C} \text{ at Time 0.}$$

$$V_O(t_1) = V_O \text{ at } 25^\circ\text{C} \text{ after 1,000 hours operation at } 25^\circ\text{C}.$$

### Thermal Hysteresis

The change of output voltage after the device is cycled through temperature from +25°C to -40°C to +125°C and back to +25°C. This is a typical value from a sample of parts put through such a cycle.

$$V_{O\_HYS} = V_O(25^\circ\text{C}) - V_{O\_TC}$$

$$V_{O\_HYS}[\text{ppm}] = \frac{V_O(25^\circ\text{C}) - V_{O\_TC}}{V_O(25^\circ\text{C})} \times 10^6$$

where:

$$V_O(25^\circ\text{C}) = V_O \text{ at } 25^\circ\text{C}.$$

$V_{O\_TC}$  =  $V_O$  at 25°C after temperature cycle at +25°C to -40°C to +125°C and back to +25°C.

## NOTES

### Input Capacitor

Input capacitors are not required on the ADR36x. There is no limit for the value of the capacitor used on the input, but a 1 μF to 10 μF capacitor on the input improves transient response in applications where the supply suddenly changes. An additional 0.1 μF capacitor in parallel also helps reduce noise from the supply.

### Output Capacitor

The ADR36x does not require output capacitors for stability under any load condition. An output capacitor, typically 0.1 μF, filters out any low level noise voltage and does not affect the operation of the part. On the other hand, the load transient response can improve with an additional 1 μF to 10 μF output capacitor in parallel. A capacitor here acts as a source of stored energy for a sudden increase in load current. The only parameter that degrades by adding an output capacitor is the turn-on time. The degradation depends on the size of the capacitor chosen.

## THEORY OF OPERATION

Band gap references are the high performance solution for low supply voltage and low power voltage reference applications, and the ADR36x family is no exception. The uniqueness of these products lies in their architecture. The ideal zero TC band gap voltage is referenced to the output not to ground (see Figure 32). Therefore, if noise exists on the ground line, it is greatly attenuated on  $V_{OUT}$ . The band gap cell consists of the PNP pair Q51 and Q52 running at unequal current densities. The difference in  $V_{BE}$  results in a voltage with a positive TC, which is amplified by a ratio of

$$2 \times \frac{R58}{R54}$$

This PTAT voltage, combined with the  $V_{BES}$  of Q51 and Q52, produces the stable band gap voltage.

Reduction in the band gap curvature is performed by the ratio of the resistors R44 and R59, one of which is linearly temperature dependent. Precision laser trimming and other patented circuit techniques are used to further enhance the drift performance.

Figure 32. Simplified Schematic

### Device Power Dissipation Considerations

The ADR36x family is capable of delivering load currents to 5 mA with an input voltage that ranges from 2.348 V (ADR360 only) to 18 V. When this device is used in applications with large input voltages, care should be taken to avoid exceeding the specified maximum power dissipation or junction temperature because it could result in premature device failure. Use the following formula to calculate a device's maximum junction temperature or dissipation:

$$P_D = \frac{T_J - T_A}{\theta_{JA}}$$

In this equation,  $T_J$  and  $T_A$  are, respectively, the junction and ambient temperatures,  $P_D$  is the device power dissipation, and  $\theta_{JA}$  is the device package thermal resistance.

## APPLICATIONS

### BASIC VOLTAGE REFERENCE CONNECTION

The circuit in Figure 33 illustrates the basic configuration for the ADR36x family. Decoupling capacitors are not required for circuit stability. The ADR36x family is capable of driving capacitive loads from 0  $\mu$ F to 10  $\mu$ F. However, a 0.1  $\mu$ F ceramic output capacitor is recommended to absorb and deliver the charge as is required by a dynamic load.

Figure 33. Basic Configuration for the ADR36x Family

### Stacking Reference ICs for Arbitrary Outputs

Some applications may require two reference voltage sources, which are a combined sum of standard outputs. Figure 34 shows how this stacked output reference can be implemented.

Figure 34. Stacking Voltage References with the ADR36x

Two reference ICs are used, and fed from an unregulated input,  $V_{IN}$ . The outputs of the individual ICs are connected in series, which provides two output voltages,  $V_{OUT1}$  and  $V_{OUT2}$ .  $V_{OUT1}$  is the terminal voltage of U1, while  $V_{OUT2}$  is the sum of this voltage and the terminal voltage of U2. U1 and U2 are chosen for the two voltages that supply the required outputs (see Table 10). For example, if both U1 and U2 are ADR361s,  $V_{OUT1}$  is 2.5 V and  $V_{OUT2}$  is 5.0 V.

Table 10. Output

U1/U2	$V_{OUT1}$	$V_{OUT2}$
ADR361/ADR365	2.5	7.5
ADR361/ADR361	2.5	5.0
ADR365/ADR361	5	7.5

### A Negative Precision Reference Without Precision Resistors

A negative reference is easily generated by adding an op amp, A1, and is configured in Figure 35.  $V_{OUTF}$  and  $V_{OUTS}$  are at virtual ground and, therefore, the negative reference can be taken directly from the output of the op amp. The op amp must be dual-supply, low offset, and rail-to-rail if the negative supply voltage is close to the reference output.

Figure 35. Negative Reference

## General Purpose Current Source

Many times in low power applications, the need arises for a precision current source that can operate on low supply voltages. The ADR36x can be configured as a precision current source (see Figure 36). The circuit configuration illustrated is a floating current source with a grounded load. The reference's output voltage is bootstrapped across  $R_{SET}$ , which sets the output current into the load. With this configuration, circuit precision is maintained for load currents ranging from the reference's supply current, typically 150  $\mu$ A, to approximately 5 mA.

Figure 36. Precision Current Source

## Trim Terminal

The ADR36x trim terminal can be used to adjust the output voltage over a nominal voltage. This feature allows a system designer to trim system errors by setting the reference to a voltage other than the standard voltage option. The resistor R1 is used for fine adjustment and can be omitted if desired. The resistor values should be carefully chosen to ensure that the maximum current drive of the part is not exceeded.
