### 74LCX16646

# Low Voltage 16-Bit Transceiver/Register with 5V Tolerant Inputs and Outputs

### **General Description**

The LCX16646 contains sixteen non-inverting bidirectional registered bus transceivers with 3-STATE outputs, providing multiplexed transmission of data directly from the input bus or from the internal storage registers. Each byte has separate control inputs which can be shorted together for full 16-bit operation. The DIR inputs determine the direction of data flow through the device. The CPAB and CPBA inputs load data into the registers on the LOW-to-HIGH transition (see Functional Description).

The LCX16646 is designed for low voltage (2.5V or 3.3V)  $V_{CC}$  applications with capability of interfacing to a 5V signal environment

The LCX16646 is fabricated with an advanced CMOS technology to achieve high speed operation while maintaining CMOS low power dissipation.

### **Features**

- 5V tolerant inputs and outputs
- 2.3V-3.6V V<sub>CC</sub> specifications provided
- $\blacksquare$  5.2 ns  $t_{PD}$  max (V  $_{CC}$  = 3.3V), 20  $\mu A$   $I_{CC}$  max
- Power down high impedance inputs and outputs
- Supports live insertion/withdrawal (Note 1)
- $\pm$ 24 mA Output Drive (V<sub>CC</sub> = 3.0V)
- Implements patented noise/EMI reduction circuitry
- Latch-up performance exceeds 500 mA
- ESD performance: Human Body Model > 2000V Machine Model > 200V

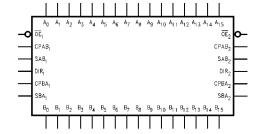

Note 1: To ensure the high-impedance state during power up or down,  $\overline{\text{OE}}$  should be tied to  $V_{CC}$  through a pull-up resistor: the minimum value or the resistor is determined by the current-sourcing capability of the driver.

### **Ordering Code:**

| Order Number   | Package Number | Package Description   |
|--|----------------|---|
| 74LCX16646MEA MS56A 56-Lead Shrink Small Outline Package (SSOP), JEDEC MO-118, 0.300" Wide |                | 56-Lead Shrink Small Outline Package (SSOP), JEDEC MO-118, 0.300" Wide      |
| 74LCX16646MTD  | MTD56          | 56-Lead Thin Shrink Small Outline Package (TSSOP), JEDEC MO-153, 6.1mm Wide |

Devices also available in Tape and Reel. Specify by appending suffix letter "X" to the ordering code.

X = Immaterial

Note 2: The data output functions may be enabled or disabled by various signals at the OE and DIR inputs. Data input functions are always enabled; i.e., data at the bus pins will be stored on every LOW-to-HIGH transition of the appropriate clock inputs. Also applies to data I/O (A and B: 8-15) and #2 control pins.

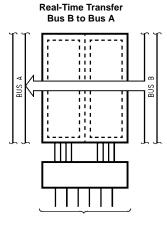

H = HIGH Voltage Level L = LOW Voltage Level 

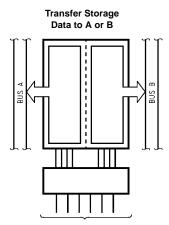

# **Functional Description**

In the transceiver mode, data present at the HIGH impedance port may be stored in either the A or B register or both. The select  $(\mathsf{SAB}_n,\ \mathsf{SBA}_n)$  controls can multiplex stored and real-time. The examples shown below demonstrate the four fundamental bus-management functions that can be performed.

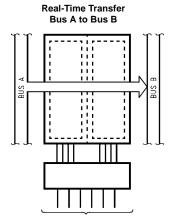

The direction control (DIR<sub>n</sub>) determines which bus will receive data when  $\overline{\text{OE}}_n$  is LOW. In the isolation mode ( $\overline{\text{OE}}_n$  HIGH), A data may be stored in one register and/or B data may be stored in the other register. When an output function is disabled, the input function is still enabled and may be used to store and transmit data. Only one of the two busses, A or B, may be driven at a time.

Note 3: The Absolute Maximum Ratings are those values beyond which the safety of the device cannot be guaranteed. The device should not be operated at these limits. The parametric values defined in the Electrical Characteristics tables are not guaranteed at the Absolute Maximum Ratings. The "Recommended Operating Conditions" table will define the conditions for actual device operation.

Note 4:  $\rm I_{\rm O}$  Absolute Maximum Rating must be observed.

 $T_{STG}$ 

Note 5: Unused inputs and I/Os must be held HIGH or LOW. They may not float.

| toshl             | Output to Output Skew (Note 7) |   | 1.0           |                  |        |                        |           |       |
| t <sub>OSLH</sub> |                                |   | 1.0           |                  |        |                        |           | ns    |

Note 7: Skew is defined as the absolute value of the difference between the actual propagation delay for any two separate outputs of the same device. The specification applies to any outputs switching in the same direction, either HIGH-to-LOW (t<sub>OSHL</sub>) or LOW-to-HIGH (t<sub>OSLH</sub>). Parameter guaranteed by design.

### LIFE SUPPORT POLICY

FAIRCHILD'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS WRITTEN APPROVAL OF THE PRESIDENT OF FAIRCHILD SEMICONDUCTOR CORPORATION. As used herein:

- Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body, or (b) support or sustain life, and (c) whose failure to perform when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in a significant injury to the user.
- A critical component in any component of a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.
