

32-bit RISC Microcontroller

CMOS

FR Series MB91107/108

MB91107/108

■ DESCRIPTION

The MB91107 is a standard single-chip microcontroller constructed around the 32-bit RISC CPU (FR* family) core with abundant I/O resources and bus control functions optimized for high-performance/high-speed CPU processing for embedded controller applications. To support the vast memory space accessed by the 32-bit CPU, the MB91107 normally operates in the external bus access mode and executes instructions on the internal 1 Kbyte cache memory and RAM (MB91107: 128 Kbytes, MB91108: 160 Kbytes) for enhanced performance.

The MB91107 is optimized for applications requiring high-performance CPU processing such as navigation systems, high-performance FAXs and printer controllers.

*: FR Family stands for FUJITSU RISC controller.

■ FEATURES

FR CPU

- 32-bit RISC, load/store architecture, 5-stage pipeline
- Operating clock frequency: Internal 50 MHz/external 25 MHz (PLL used at source oscillation 12.5 MHz)
- General purpose registers: 32 bits × 16
- 16-bit fixed length instructions (basic instructions), 1 instruction/1 cycle
- Memory to memory transfer, bit processing, barrel shifter processing: Optimized for embedded applications
- Function entrance/exit instructions, multiple load/store instructions of register contents, instruction systems supporting high level languages

(Continued)

■ PACKAGE

120-pin Plastic LQFP

(FPT-120P-M21)

(Continued)

- Register interlock functions, efficient assembly language coding
- Branch instructions with delay slots: Reduced overhead time in branch executions
- Internal multiplier/supported at instruction level
 - Signed 32-bit multiplication: 5 cycles
 - Signed 16-bit multiplication: 3 cycles
- Interrupt (push PC and PS): 6 cycles, 16 priority levels

Bus interface

- Clock doubler: Internal 50 MHz, external bus 25 MHz operation
- 25-bit address bus (32 Mbytes memory space)
- 8/16-bit data bus
- Basic external bus cycle: 2 clock cycles
- Chip select outputs for setting down to a minimum memory block size of 64 Kbytes: 8
- Interface supported for various memory technologies
 - DRAM interface (area 4 and 5)
- Automatic wait cycle insertion: Flexible setting, from 0 to 7 for each area
- Unused data/address pins can be configured as input/output ports
- Little endian mode supported (Select 1 area from area 1 to 5)

DRAM interface

- 2 banks independent control (area 4 and 5)
- Double CAS DRAM (normal DRAM I/F) / Single CAS DRAM / Hyper DRAM
- Basic bus cycle: Normally 5 cycles, 2-cycle access possible in high-speed page mode
- Programmable waveform: Automatic 1-cycle wait insertion to RAS and CAS cycles
- DRAM refresh
 - CBR refresh (interval time configurable by 6-bit timer)
 - Self-refresh mode
- Supports 8/9/10/12-bit column address width
- 2CAS/1WE, 2WE/1CAS selective

Cache memory

- 1-Kbyte instruction cache memory
- 2 way set associative
- 32 block/way, 4 entry(4 word)/block
- Lock function: For specific program code to be resident in cache memory

DMAC (DMA controller)

- 8 channels
- Transfer incident/external pins/internal resource interrupt requests
- Transfer sequence: Step transfer/block transfer/burst transfer/continuous transfer
- Transfer data length: 8 bits/16 bits/32 bits selective
- NMI/interrupt request enables temporary stop operation

UART

- 3 independent channels
- Full-duplex double buffer
- Data length: 7 bits to 9 bits (non-parity), 6 bits to 8 bits (parity)
- Asynchronous (start-stop system), CLK-synchronized communication selective
- Multi-processor mode
- Internal 16-bit timer (U-TIMER) operating as a proprietary baud rate generator: Generates any given baud rate

(Continued)

(Continued)

- Use external clock can be used as a transfer clock
- Error detection: Parity, frame, overrun

10-bit A/D converter (successive approximation conversion type)

- 10-bit resolution, 4 channels
- Successive approximation type: Conversion time of 5.6 μ s at 25 MHz
- Internal sample and hold circuit
- Conversion mode: Single conversion/scanning conversion/repeated conversion selective
- Start: Software/external trigger/internal timer selective

16-bit reload timer

- 16-bit timer: 3 channels
- Internal clock: 2 clock cycle resolution, divide by 2/8/32 selective

Other interval timers

- 16-bit timer: 3 channels (U-TIMER)
- PWM timer: 4 channels
- Watchdog timer: 1 channel

Bit search module

First bit transition “1” or “0” from MSB can be detected in 1 cycle

Interrupt controller

- External interrupt input: Non-maskable interrupt ($\overline{\text{NMI}}$), normal interrupt 8 (INT0 to INT7)
- Internal interrupt incident: UART, DMA controller (DMAC), A/D converter, U-TIMER and delayed interrupt module
- Priority levels of interrupts are programmable except for non-maskable interrupt (in 16 levels)

Others

- Reset cause: Power-on reset/hardware standby/watchdog timer/software reset/external reset
- Low-power consumption mode: Sleep mode/stop mode
- Clock control
 - Gear function: Operating clocks for CPU and peripherals are independently selective
 - Gear clock can be selected from 1/1, 1/2, 1/4 and 1/8 (or 1/2, 1/4, 1/8 and 1/16)
 - However, operating frequency for peripherals is less than 25 MHz.
- Packages: LQFP-120
- CMOS technology (0.35 μ m): MB91V108 (0.25 μ m) Development model
MB91107 (0.25 μ m) Production model
MB91108 (0.25 μ m) Production model
- Power supply voltage: 3.3 V \pm 0.3 V (internal regulator)

MB91107/108

■ PIN ASSIGNMENT

■ PIN DESCRIPTION

Pin no.	Pin name	Circuit type	Function
85 86 87 88 89 90 91 92	D16/P20 D17/P21 D18/P22 D19/P23 D20/P24 D21/P25 D22/P26 D23/P27	C	Bit 16 to bit 23 of external data bus. Can be configured as ports (P20 to P27) when external data bus width is set to 8-bit.
93 94 95 96 97 98 99 100	D24 D25 D26 D27 D28 D29 D30 D31	C	Bit 24 to bit 31 of external data bus.
102 103 104 105 106 107 108 109 111 112 113 114 115 116 117 118	A00 A01 A02 A03 A04 A05 A06 A07 A08 A09 A10 A11 A12 A13 A14 A15	F	Bit 00 to bit 15 of external address bus.
120 1 2 3 4 5 6 7	A16/P60 A17/P61 A18/P62 A19/P63 A20/P64 A21/P65 A22/P66 A23/P67	F	Bit 16 to bit 23 of external address bus. Can be configured as ports(P60 to P67) when not used as address bus.
8	A24/P70	F	Bit 24 of external address bus. Can be configured as a port(P70) when not used as address bus.
79	RDY/P80	C	External ready input. Inputs "0" when bus cycle is being executed and not completed. Can be configured as a port when this pin is not used.

(Continued)

MB91107/108

Pin no.	Pin name	Circuit type	Function									
80	$\overline{\text{BGRNT}}/\text{P81}$	F	External bus release acknowledge output. Outputs "L" level when external bus is released. Can be configured as a port when this pin is not used.									
81	BRQ/P82	P	External bus release request input. Inputs "1" when release of external bus is required. Can be configured as a port when this pin is not used.									
82	$\overline{\text{RD}}$	M	Read strobe output pin for external bus.									
83	$\overline{\text{WR0}}$	M	Write strobe output pin for external bus. Relation between control signals and effective byte locations is as follows:									
84	$\overline{\text{WR1}}/\text{P85}$	F	<table border="1"> <thead> <tr> <th></th> <th>16-bit bus width</th> <th>8-bit bus width</th> </tr> </thead> <tbody> <tr> <td>D31 to D24</td> <td>$\overline{\text{WR0}}$</td> <td>$\overline{\text{WR0}}$</td> </tr> <tr> <td>D23 to D16</td> <td>$\overline{\text{WR1}}$</td> <td>(I/O port enabled)</td> </tr> </tbody> </table>		16-bit bus width	8-bit bus width	D31 to D24	$\overline{\text{WR0}}$	$\overline{\text{WR0}}$	D23 to D16	$\overline{\text{WR1}}$	(I/O port enabled)
				16-bit bus width	8-bit bus width							
D31 to D24	$\overline{\text{WR0}}$	$\overline{\text{WR0}}$										
D23 to D16	$\overline{\text{WR1}}$	(I/O port enabled)										
			Note: $\overline{\text{WR1}}$ is Hi-Z during resetting. Attach an external pull-up resistor when using at 16-bit bus width.									
65	$\overline{\text{CS0}}$	M	Chip select 0 output ("L" active).									
66 67 68 69 70	$\overline{\text{CS1}}/\text{PA1}$ $\overline{\text{CS2}}/\text{PA2}$ $\overline{\text{CS3}}/\text{PA3}$ $\overline{\text{CS4}}/\text{PA4}$ $\overline{\text{CS5}}/\text{PA5}$	F	Chip select 1 output ("L" active). Chip select 2 output ("L" active). Chip select 3 output ("L" active). Chip select 4 output ("L" active). Chip select 5 output ("L" active). Can be configured as ports when PA1 to PA5 are not used.									
71	CLK/PA6	F	System clock output. Outputs clock signal of external bus operating frequency. Can be configured as a port when PA6 is not used.									
56 57 58 59 60 61 62 63	RAS0/PB0 CASL/PB1 CASH/PB2 $\overline{\text{WE0}}/\text{PB3}$ RAS1/PB4 CASL/PB5 CASH/PB6 $\overline{\text{WE1}}/\text{PB7}$	F	RAS output for DRAM bank 0. CASL output for DRAM bank 0. CASH output for DRAM bank 0. $\overline{\text{WE}}$ output for DRAM bank 0 ("L" active). RAS output for DRAM bank 1. CASL output for DRAM bank 1. CASH output for DRAM bank 1. $\overline{\text{WE}}$ output for DRAM bank 1 ("L" active). Can be configured as a port when PB0 to PB7 are not used.									
76 77 78	MD0 MD1 MD2	G	Mode pins 0 to 2. MCU basic operation mode is set by these pins. Directly connect these pins with V_{CC} or V_{SS} for use.									
53 54	X1 X0	A	Clock (oscillator) output. Clock (oscillator) input.									
74	$\overline{\text{RST}}$	B	External reset input.									
73	$\overline{\text{HST}}$	H	Hardware standby input ("L" active).									

(Continued)

Pin no.	Pin name	Circuit type	Function
72	$\overline{\text{NMI}}$	H	NMI (non-maskable interrupt pin) input ("L" active).
42	SC2/PE0	F	(SC2) Clock I/O pin for UART2. Clock output is available when clock output of UART2 is enabled.
			(PE0) General purpose I/O port. This function is available when UART2 clock output is disabled.
43	DREQ0/PE1	F	(DREQ0) External transfer request input pins for DMA. This pin is used for input when external trigger is selected to cause DMAC operation, and it is necessary to disable output for other functions from this pin unless such output is made intentionally.
			(PE1) General purpose I/O port.
44	DACK0/PE2	F	(DACK0) External transfer request acknowledge output pin for DMAC (ch. 0). This function is available when transfer request output for DMAC is enabled.
			(PE2) General purpose I/O port. This function is available when transfer request acknowledge output for DMAC or DACK0 output is disabled.
45	EOP0/PE3	F	(EOP0) Can be configured as DMAC EOP OUTPUT (ch.0) when DMAC EOP output is enable.
			(PE3) General purpose I/O port.
46	DREQ1/PE4	F	(DREQ1) External transfer request input pins for DMA. This pin is used for input when external trigger is selected to cause DMAC operation, and it is necessary to disable output for other functions from this pin unless such output is made intentionally.
			(PE4) General purpose I/O port.
47	DACK1/PE5	F	(DACK1) External transfer request acknowledge output pin for DMAC (ch. 1). This function is available when transfer request output for DMAC is enabled.
			(PE5) General purpose I/O port. This function is available when transfer request acknowledge output for DMAC or DACK1 output is disabled.
48	EOP1/PE6	F	(EOP1) Can be configured as DMAC EOP OUTPUT (ch.1) when DMAC EOP output is enable.
			(PE6) General purpose I/O port.
49	DREQ2/PE7	F	(DREQ2) External transfer request input pins for DMA. This pin is used for input when external trigger is selected to cause DMAC operation, and it is necessary to disable output for other functions from this pin unless such output is made intentionally.
			(PE7) General purpose I/O port.

(Continued)

MB91107/108

Pin no.	Pin name	Circuit type	Function
33	SI0/PF0	F	(SI0) UART0 data input pin. This pin is used for input during UART0 is in input operation, and it is necessary to disable output for other functions from this pin unless such output is made intentionally.
			(PF0) General purpose I/O port.
35	SO0/PF1	F	(SO0) UART0 data output pin. This function is available when UART0 data output is enabled.
			(PF1) General purpose I/O port. This function is available when UART0 data output is disabled.
36	SC0/PF2	F	(SC0) UART0 clock I/O pin. Clock output is available when UART0 clock output is enabled.
			(PF2) General purpose I/O port. This function is available when UART0 clock output is disabled.
37	SI1/PF3	F	(SI1) UART1 data input pin. This pin is used for input during UART1 is in input operation, and it is necessary to disable output for other functions from this pin unless such output is made intentionally.
			(PF3) General purpose I/O port.
38	SO1/PF4	F	(SO1) UART1 data output pin. This function is available when UART1 data output is enabled.
			(PF4) General purpose I/O port. This function is available when UART1 data output is disabled.
39	SC1/PF5	F	(SC1) Clock I/O pin for UART1. Clock output is available when clock output of UART1 is enabled.
			(PF5) General purpose I/O port. This function is available when UART1 clock output is disabled.
40	SI2/PF6	F	(SI2) UART2 data input pin. This pin is used for input during UART2 is in input operation, and it is necessary to disable output for other functions from this pin unless such output is made intentionally.
			(PF6) General purpose I/O port.
41	SO2/PF7	F	(SO2) UART2 data output pin. This function is available when UART2 data output is enabled.
			(PF7) General purpose I/O port. This function is available when UART2 data output is disabled.

(Continued)

Pin no.	Pin name	Circuit type	Function
25 26 27 28 29 30 31 32	INT0/PG0 INT1/PG1 INT2/PG2 INT3/PG3 INT4/PG4 INT5/PG5 INT6/PG6 INT7/PG7	I	(INT0 to INT7) External interrupt request input pin. This pin is used for input during corresponding interrupt is enabled, and it is necessary to disable output for other functions from this pin unless such output is made intentionally. (PG0 and PG7) General purpose I/O port.
16 17	TRG0/PH0 TRG1/PH1	F	(TRG0 and TRG1) PWM timer external trigger input pin. This function is available when PH0 and PH1 data outputs are disabled. (PH0 and PH1) General purpose I/O port.
18 19	TRG2/PH2/ $\overline{CS6}$ TRG3/PH3/ $\overline{CS7}$	F	(TRG2 and TRG3) PWM timer external trigger input pin. This function is available when PH2 and PH3 data outputs are disabled. (PH2 and PH3) Can be configured as a I/O port when TRG2, TRG3, $\overline{CS6}$ and $\overline{CS7}$ are not used. Chip select 6 output ("L" active). Chip select 7 output ("L" active).
20 21 22 23	OCPA0/PH4 OCPA1/PH5 OCPA2/PH6 OCPA3/PH7	F	(OCPA0 to OCPA3) PWM timer output pin. This function is available when PWM timer output is enabled. (PH4 to PH7) General purpose I/O port.
50	DACK2/PI0	F	(DACK2) External transfer request acknowledge output pin for DMAC (ch. 2). This function is available when transfer request output for DMAC is enabled. (PI0) General purpose I/O port. This function is available when transfer request acknowledge output for DMAC or DACK2 output is disabled.
51	EOP2/PI1/ \overline{ATG}	F	(EOP2) EOP output pin for DMAC (ch.1). This function is available when EOP output for DMAC is enabled. (PI1) General purpose I/O port. This function is available when transfer complete acknowledge output for DMAC output is disabled. (\overline{ATG}) External trigger input pin for A/D converter. This pin is used for input when external trigger is selected to cause A/D converter operation, and it is necessary to disable output for other functions from this pin unless such output is made intentionally.
12 to 15	AN0 to AN3	N	(AN0 to AN3) Analog input pins of A/D converter. This function is available when AIC register is set to specify analog input mode.
9	AV _{CC}	—	Power supply pin (V _{CC}) for A/D converter.
10	AVRH	—	Reference voltage input (high) for A/D converter. Make sure to turn on and off this pin with potential of AVRH or more applied to V _{CC} .

(Continued)

MB91107/108

(Continued)

Pin no.	Pin name	Circuit type	Function
11	AV _{ss} / AVRL	—	Power supply pin (V _{ss}) for A/D converter and reference voltage input pin (low).
24, 55, 110	V _{cc}	—	Power supply pin (V _{cc}) for digital circuit. Always three pins must be connected to the power supply
64	C	—	Bypass capacitor pin for internal capacitor. Refer to the HANDLING DEVICES.
34, 52, 75, 101, 119	V _{ss}	—	Earth level (V _{ss}) for digital circuit.

Note : In most of the above pins, I/O port and resource I/O are multiplexed e.g. xxx/Pxxx. In case of conflict between output of I/O port and resource I/O, priority is always given to the output of resource I/O.

■ DRAM CONTROL REGISTER

Pin name	Data bus 16-bit mode		Data bus 8-bit mode	Remarks
	2CAS/1WR mode	1CAS/2WR mode		
RAS0	Area 4 RAS	Area 4 RAS	Area 4 RAS	Correspondence of “L” “H” to lower address 1 bit (A0) in data bus 16-bit mode. “L”: “0” “H”: “1”

■ HANDLING DEVICES

1. Preventing Latchup

In CMOS ICs, applying voltage higher than V_{CC} or lower than V_{SS} to input/output pin or applying voltage over rating across V_{CC} and V_{SS} may cause latchup.

This phenomenon rapidly increases the power supply current, which may result in thermal breakdown of the device. Make sure to prevent the voltage from exceeding the maximum rating.

2. Treatment of Pins

•Treatment of unused pins

Unused pins left open may cause malfunctions. Make sure to connect them to pull-up or pull-down resistors.

•Handling the output pins

Connecting an output pin to the power supply, to another output pin, or to a large-capacitance load may cause a large current to flow. Since letting it flow for an extended period of time degrades the device, be careful in using the device not to exceed the maximum rating.

•Power supply pins

When there are several V_{CC} and V_{SS} pins, each of them is equipotentially connected to its counterpart inside of the device, minimizing the risk of malfunctions such as latch up. To further reduce the risk of malfunctions, to prevent EMI radiation, to prevent strobe signal malfunction resulting from creeping-up of ground level and to observe the total output current standard, connect all V_{CC} and V_{SS} pins to the power supply or GND.

It is preferred to connect V_{CC} and V_{SS} of MB91107 to power supply with minimal impedance possible.

It is also recommended to connect a ceramic capacitor as a bypass capacitor of about 0.1 μF between V_{CC} and V_{SS} at a position as close as possible to MB91107.

•Mode setting pins (MD0 to MD2)

Connect mode setting pins (MD0 to MD2) directly to V_{CC} or V_{SS} .

Arrange each mode setting pin and V_{CC} or V_{SS} patterns on the printed circuit board as close as possible and make the impedance between them minimal to prevent mistaken entrance to the test mode caused by noises.

•Crystal oscillator circuit

Noises around X0 and X1 pins may cause malfunctions of MB91101. In designing the PC board, layout X0, X1 and crystal oscillator (or ceramic oscillator) and bypass capacitor for grounding as close as possible.

It is strongly recommended to design PC board so that X1 and X0 pins are surrounded by grounding area for stable operation.

3. Notes on Use

•External reset input

The $\overline{\text{RST}}$ pin requires "L" level input for at least five machine cycles before the the internal circuitry can be completely reset.

•External clock

To use an external clock, in principle, supply the X0 and X1 pins with a clock signal opposite in phase to the X0. To use the STOP mode (oscillation stop mode) along with the external clock, in which the X1 pin stops with "H" output, you should insert an external resistor of about 1 kilohm to prevent a collision between outputs.

Given the next page is an example of using an external clock.

- Using an external clock (for normal use)

Note: To use the STOP mode (oscillation stop mode), insert a resistor to the X1 pin.

4. Notes on Internal DC-DC Regulator

- Since this product contains a regulator, be sure to supply current at 3.3 V to the VCC pin and insert a bypass capacitor of about 0.1 μF to the C pin for the regulator.
- The A/D converter requires a 3.3-V power supply separately.

- Connecting to power supply

- Notes on using the STOP mode

The regulator built in this product stops in the STOP mode. If the regulator stops due to a malfunction caused by noise or a fault in the power supply during normal operation, the internal 2.5-V power supply may go below the lower limit of the guaranteed operating voltage range. When using the STOP mode with the internal regulator, therefore, be sure to supply an auxiliary external power to prevent the 3.3-V power supply from coming down. Even in that case, the internal regulator can be restarted by input of a reset signal (To restart the regulator, keep the reset pin at the L level for at least the oscillation settling time).

- Using STOP mode with 3.3 V power supply

5. Turning on the Power Supply

• $\overline{\text{RST}}$ pin

When turning on the power supply, never fail to start from setting the $\overline{\text{RST}}$ pin to “L” level. And after the power supply voltage goes to V_{CC} level, at least after ensuring the time for 5 machine cycles, then set to “H” level.

•Pin Condition at Turning on the Power Supply

The pin condition at turning on the power supply is unstable. The circuit starts being initialized after turning on the power supply and then starting oscillation and then the operation of the internal regulator becomes stable. So it takes about 42 ms for the pin to be initialized from the oscillation starting at the source oscillation 12.5 MHz. Take care that the pin condition may be output condition at initial unstable condition.

(With the MB91107, however, initialization can be achieved in less than about 42 ms after turning on the internal power supply by maintaining the $\overline{\text{RST}}$ pin at “L” level.)

•Source Oscillation Input at Turning on the Power Supply

At turning on the power supply, never fail to input the clock before cancellation of the oscillation stabilizing waiting.

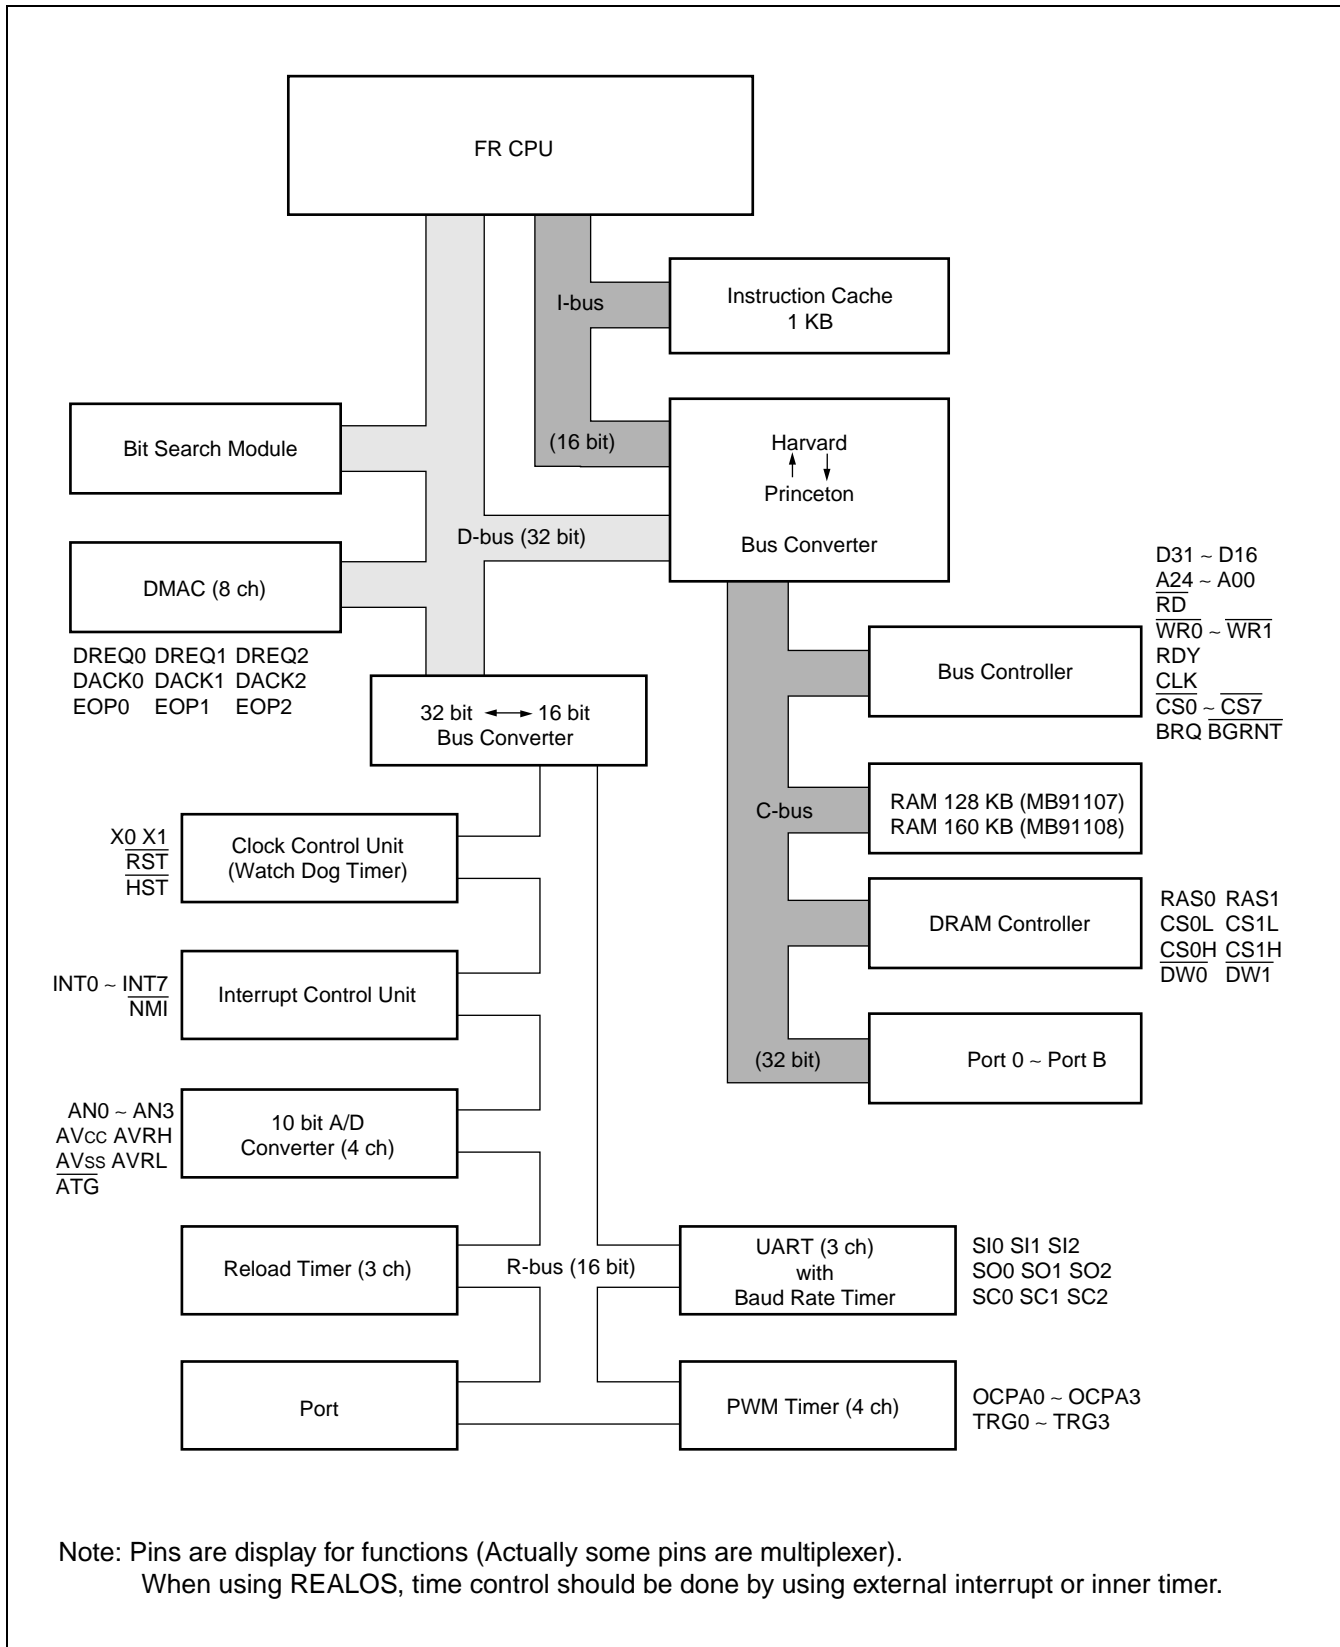

•Hardware Stand-by at Turning on the Power Supply

When turning on the power supply with the $\overline{\text{HST}}$ pin being set to “L” level, the hardware doesn’t stand by. However the $\overline{\text{HST}}$ pin becomes available after the reset cancellation, the $\overline{\text{HST}}$ pin must once be back to “H” level.

•Power on Reset

Make sure to make power on reset at turning on the power supply or returning on the power supply when the power supply voltage is below the warranty range for normal operation.

■ BLOCK DIAGRAM

■ CPU CORE

1. Memory Space

The FR family has a logical address space of 4 Gbytes (2^{32} bytes) and the CPU linearly accesses the memory space.

2. Registers

The FR family has two types of registers; dedicated registers embedded on the CPU and general-purpose registers on memory.

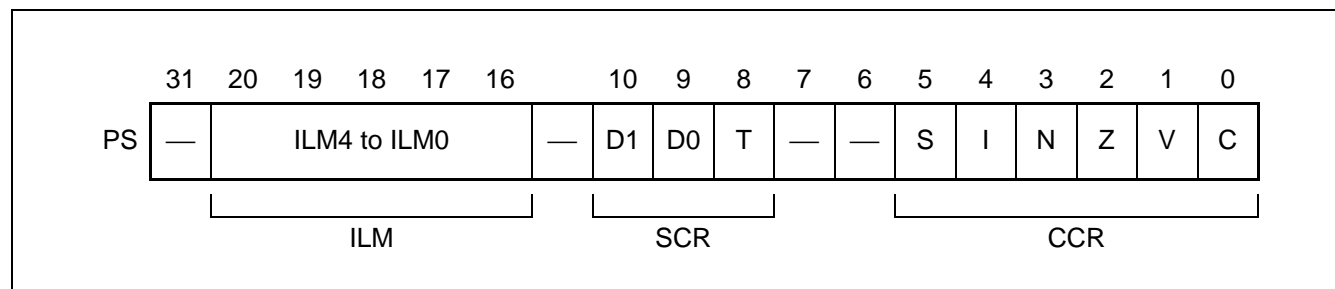

•Dedicated registers

- Program counter (PC) : 32-bit length, indicates the location of the instruction to be executed.
- Program status (PS) : 32-bit length, register for storing register pointer or condition codes.
- Table base register (TBR) : Holds top address of vector table used in EIT (Exceptional/Interrupt/Trap processing).
- Return pointer (RP) : Holds address to resume operation after returning from a subroutine.
- System stack pointer (SSP) : Indicates system stack space.
- User's stack pointer (USP) : Indicates user's stack space.
- Multiplication/division result register (MDH/MDL) : 32-bit length, register for multiplication/division.

	32 bit	← 32 bit →	Initial value
Program counter	PC		XXXX XXXX Indeterminate
Program status	PS		
Table base register	TBR		000F FC00
Return pointer	RP		XXXX XXXX Indeterminate
System stack pointer	SSP		0000 0000
User's stack pointer	USP		XXXX XXXX Indeterminate
Multiplication/division result register	MDH		XXXX XXXX Indeterminate
	MDL		XXXX XXXX Indeterminate

•Program status (PS)

The PS register is for holding program status and consists of a condition code register (CCR), a system condition code register (SCR) and a interrupt level mask register (ILM).

MB91107/108

•Condition code register (CCR)

- S-flag : Specifies a stack pointer used as R15.
- I-flag : Controls user interrupt request enable/disable.
- N-flag : Indicates sign bit when division result is assumed to be in the 2's complement format.
- Z-flag : Indicates whether or not the result of division was "0".
- V-flag : Assumes the operand used in calculation in the 2's complement format and indicates whether or not overflow has occurred.
- C-flag : Indicates if a carry or borrow from the MSB has occurred.

•System condition code register (SCR)

- T-flag : Specifies whether or not to enable step trace trap.

•Interrupt level mask register (ILM)

ILM4 to ILM0 : Register for holding interrupt level mask value. The value held by this register is used as a level mask. When an interrupt request issued to the CPU is higher than the level held by ILM, the interrupt request is accepted.

ILM4	ILM3	ILM2	ILM1	ILM0	Interrupt level	High-low
0	0	0	0	0	0	High
						↑ ↓
0	1	1	1	1	15	
1	1	1	1	1	31	Low

■ GENERAL-PURPOSE REGISTERS

R0 to R15 are general-purpose registers embedded on the CPU. These registers functions as an accumulator and a memory access pointer.

Of the above 16 registers, following registers have special functions. To support the special functions, part of the instruction set has been sophisticated to have enhanced functions.

- R13: Virtual accumulator (AC)
- R14: Frame pointer (FP)
- R15: Stack pointer (SP)

Upon reset, values in R0 to R14 are not fixed. Value in R15 is initialized to be 0000 0000H (SSP value).

MB91107/108

■ SETTING MODE

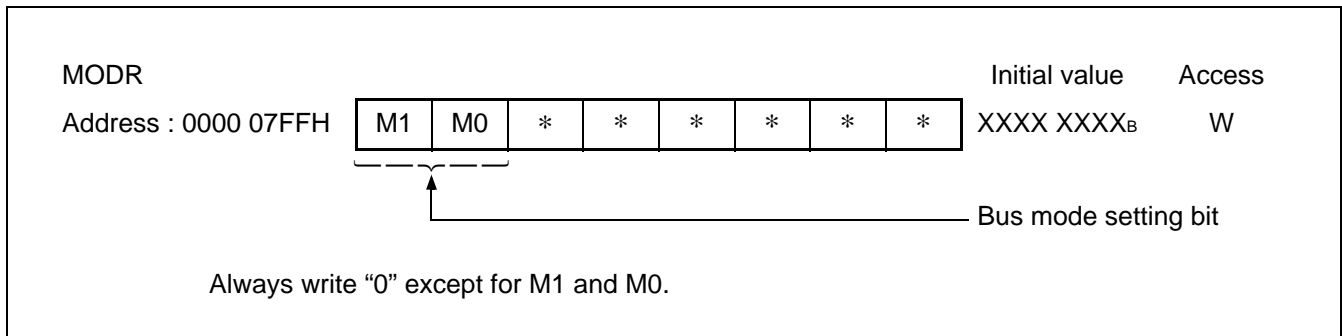

1. Pin

•Mode setting pins and modes

Mode setting pins			Mode name	Reset vector access area	External data bus width	Bus mode
MD2	MD1	MD0				
0	0	0	External vector mode 0	External	8 bits	External ROM/external bus mode
0	0	1	External vector mode 1	External	16 bits	
0	1	0	—	—	—	Inhibited
0	1	1	Internal vector mode	Internal	(Mode register)	Inhibited
1	—	—	—	—	—	Inhibited

2. Registers

•Mode data

•Bus mode setting bits and functions

M1	M0	Functions	Note
0	0	Single-chip mode	
0	1	Internal ROM/external bus mode	Inhibited
1	0	External ROM/external bus mode	
1	1	—	Inhibited

Note : MB91107 places 128-KB internal RAM in the internal ROM area.
To use the 128-KB internal RAM, be sure to set '01'.

■ I/O MAP

The remainder of this section contains a list of the registers for peripheral resources in memory space.

Address	Register name	Register name	Access	Resource name	Initial value
000001 _H	PDR2	Port 2 data registe	R/W	Port Data Register	XXXXXXXX _B
000004 _H	PDR7	Port 7 data registe	R/W		-----X _B
000005 _H	PDR6	Port 6 data registe	R/W		XXXXXXXX _B

■ PERIPHERAL RESOURCES

1. I/O Ports

There are 2 types of I/O port register structure; PDR (port data register) and DDR (data direction register) .

- For input (DDR = "0") setting;
 PDR reading operation: reads level of corresponding external pin.
 PDR writing operation: writes set value to PDR.
- For output (DDR = "1") setting;
 PDR reading operation: reads PDR value.
 PDR writing operation: outputs PDR value to corresponding external pin.

2. DMA Controller (DMAC)

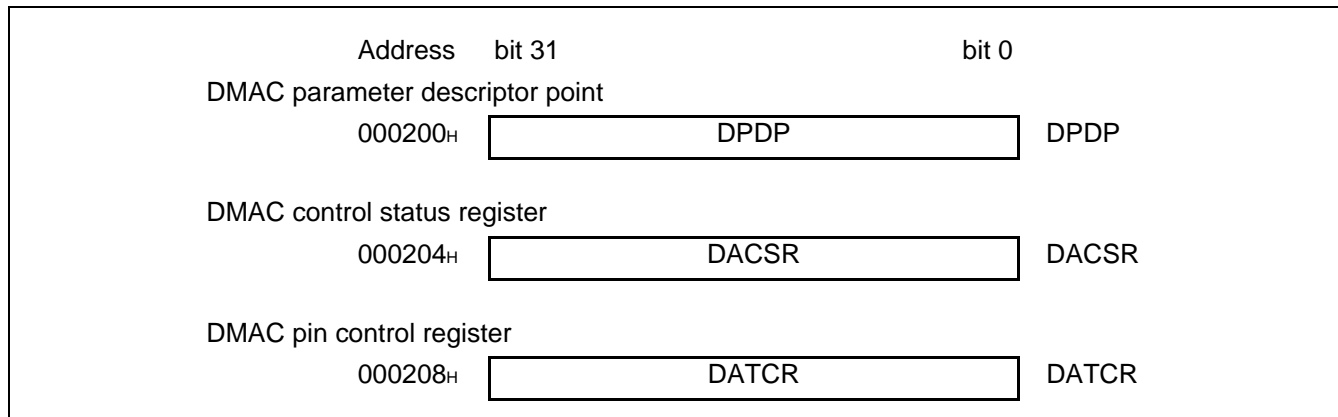

The DMA controller is a module embedded in FR family devices, and performs DMA (direct memory access) transfer.

DMA transfer performed by the DMA controller transfers data without intervention of CPU, contributing to enhanced performance of the system.

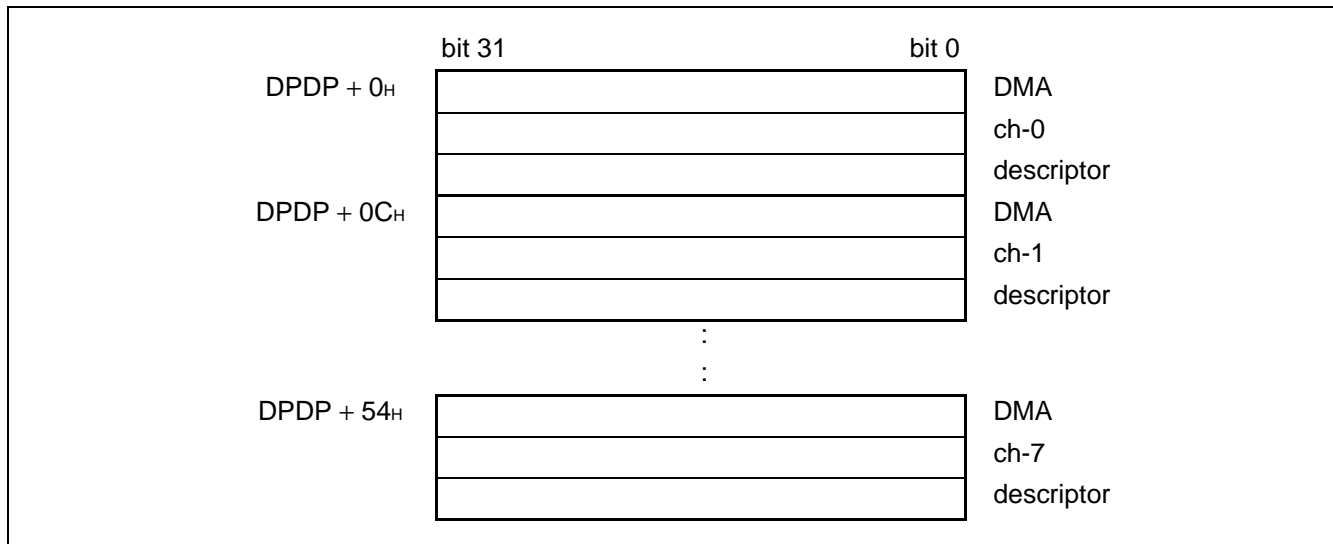

- 8 channels
- Mode: single/block transfer, burst transfer and continuous transfer: 3 kinds of transfer
- Transfer all through the area
- Max. 65536 of transfer cycles
- Interrupt function right after the transfer
- Selectable for address transfer increase/decrease by the software
- External transfer request input pin, external transfer request accept output pin, external transfer complete output pin three pins for each

(1) Register configuration

DMAC (DMAC internal registers)

RAM (DMA descriptor)

(2) Block diagram

3. UART

The UART is a serial I/O port for supporting asynchronous (start-stop system) communication or CLK synchronous communication, and it has the following features.

The MB91107 consists of 3 channels of UART.

- Full double double buffer
- Both a synchronous (start-stop system) communication and CLK synchronous communication are available.
- Supporting multi-processor mode
- Perfect programmable baud rate

Any baud rate can be set by internal timer (refer to section “4. U-TIMER”).

- Any baud rate can be set by external clock.
- Error checking function (parity, framing and overrun)
- Transfer signal: NRZ code
- Enable DMA transfer/start by interrupt.

(2) Block diagram

4. U-TIMER (16-bit Timer for UART Baud Rate Generation)

The U-TIMER is a 16-bit timer for generating UART baud rate. Combination of chip operating frequency and reload value of U-TIMER allows flexible setting of baud rate.

The U-TIMER operates as an interval timer by using interrupt issued on counter underflow.

The MB91107 has 3 channel U-TIMER embedded on the chip. An interval of up to $2^{16} \times \phi$ can be counted.

(1) Register configuration

- U-TIMER register ch 0 to ch 2

Address	bit 15	bit 0	Initial value	Access
UTIM0 : 000078 _H	UTIM0 to UTIM2		00000000 _B	R
UTIM1 : 00007C _H			00000000 _B	
UTIM2 : 000080 _H				

- U-TIMER reload register ch 0 to ch 2

UTIM2 : 000083 _H				

R/W : Readable and writable
 R : Read only
 W : Write only
 - : Unused

(2) Block diagram

5. PWM Timer

The PWM timer can output high accurate PWM waves efficiently.

MB91101 has inner 4-channel PWM timers, and has the following features.

- Each channel consists of a 16-bit down counter, a 16-bit data register with a buffer for cycle setting, a 16-bit compare register with a buffer for duty setting, and a pin controller.
 - The count clock of a 16-bit down counter can be selected from the following four inner clocks.
 - Inner clock ϕ , $\phi/4$, $\phi/16$, $\phi/64$
 - The counter value can be initialized “FFFF_H” by the resetting or the counter borrow.
 - PWM output (each channel)
 - Resister description
 - Cycle setting register: Reload data register with a buffer
 - Duty factor setting register: Compare register with a buffer
 - Transfer from the buffers uses the counter borrow method.
 - Pin control outline
 - Set to '1' at a duty factor match. (Preferential)
 - Set to '0' at a counter borrow.
 - The output value fixed mode is available, which makes all 'L' (or 'H') output easy.
 - The polarity can also be specified.
 - Interrupt requests can be generated by selected a combination of events:
 - This timer is activated.
 - A counter borrow is generated (cycle match).
 - A duty factor match is generated.
 - A counter borrow is generated (cycle match) or a duty factor match is generated.
- DMA transfer can be invoked by the above interrupt request.
- Simultaneous activation of multiple channels of the PWM timer can be set by software or by using another interval timer. Restarting the PWM timer during operation can also be set.

•General construction

•For one channel

6. 16-bit Reload Timer

The 16-bit reload timer consists of a 16-bit down counter, a 16-bit reload timer, a prescaler for generating internal count clock and control registers.

Internal clock can be selected from 3 types of internal clocks (divided by 2/8/32 of machine clock).

The DMA transfer can be started by the interruption.

The MB91107 consists of 3 channels of the 16-bit reload timer.

(2) Block diagram

8. A/D Converter (Successive Approximation Conversion Type)

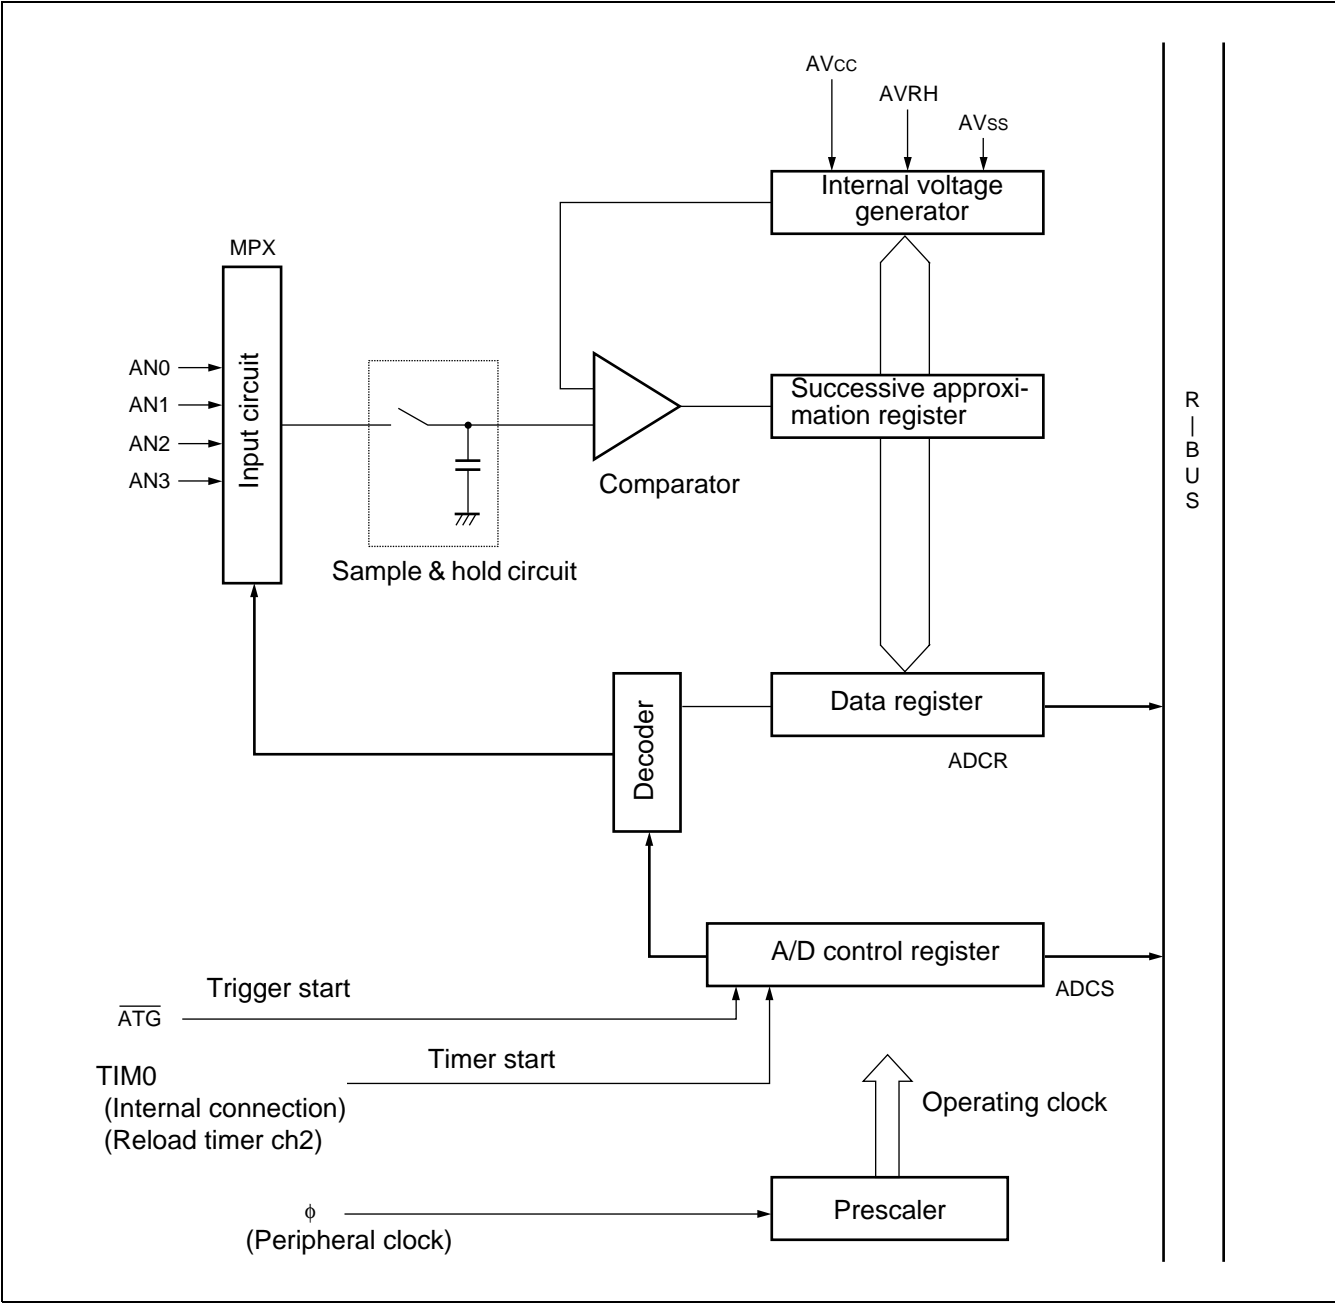

The A/D converter is the module which converts an analog input voltage to a digital value, and it has following features.

- Minimum converting time: 5.6 μ s/ch. (system clock: 25 MHz)
- Inner sample and hold circuit
- Resolution: 10 bits
- Analog input can be selected from 4 channels by program.
 - Single convert mode: 1 channel is selected and converted.
 - Scan convert mode: Converting continuous channels. Maximum 4 channels are programmable.
 - Continuous convert mode: Converting the specified channel repeatedly.
 - Stop convert mode: After converting one channel then stop and wait till next activation synchronising at the beginning of conversion can be performed.
- DMA transfer operation is available by interruption.
- Operating factor can be selected from the software, the external trigger (falling edge), and 16-bit reload timer (rising edge).

(2) Block diagram

9. Interrupt Controller

The interrupt controller processes interrupt acknowledgments and arbitration between interrupts.

•Hardware configuration

This module consists of the following components:

- ICR register
- Interrupt priority evaluation circuit
- Interrupt level/interrupt number (vector) generator
- HOLD request cancel request generator

•Main Features

The major functions of this module are listed below:

- NMI request/interrupt request detection
- Priority evaluation (interrupt level and number)
- Transfer of interrupt level as evaluation factor (to the CPU)
- Transfer of interrupt number as evaluation factor (to the CPU)
- Instruction of returning from the stop mode by NMI/interrupt generation
- Generating a request to cancel the HOLD request to the bus master

(1) Register configuration

•Interrupt control register 0 to 47

•Request level register for canceling hold request

Address	bit 7	bit 0	Initial value	Access
00000431H	HRCL		--- 11111B	R/W

R/W : Readable and writable

- : Unused

(2) Block diagram

*1 : DLY I stands for delayed interrupt module (delayed interrupt generation block) (refer to the section "11. Delayed Interrupt Module" for detail).

*2 : $INT0$ is a wake-up signal to clock control block in the sleep or stop status.

*3 : HLDCAN is a bus release request signal for bus masters other than CPU.

*4 : LEVEL 4 to LEVEL 0 are interrupt level outputs.

*5 : VCT5 to VCT0 are interrupt vector outputs.

10. External Interrupt/NMI Control Block

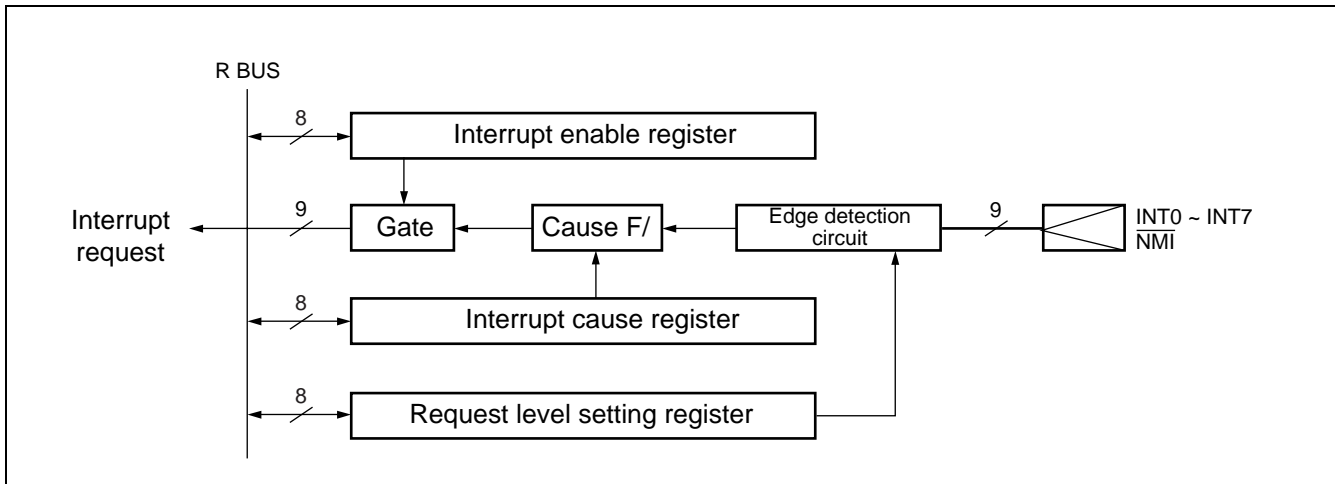

The external interrupt/NMI control block controls external interrupt request signals input to $\overline{\text{NMI}}$ pin and INT0 to INT7 pins.

Detecting levels can be selected from "H", "L", rising edge and falling edge (not for $\overline{\text{NMI}}$ pin).

(1) Register configuration

•Interrupt enable register						
Address	bit 15	bit 8	bit 7	bit 0	Initial value	Access

(2) Block diagram

11. Delayed Interrupt Module

Delayed interrupt module is a module which generates a interrupt for changing a task. By using this delayed interrupt module, an interrupt request to CPU can be generated/cancelled by the software. Refer to the section "9. Interrupt Controller" for delayed interrupt module block diagram.

•Register configuration

•Delayed interrupt control register				
Address	bit 7	bit 0	Initial value	Access
000430 _H	DICR		----- 0 _B	R/W
	R/W : Readable and writable			
	- : Unused			

12. Clock Generation (Low-power consumption mechanism)

The clock control block is a module which undertakes the following functions.

- CPU clock generation (including gear function)
- Peripheral clock generation (including gear function)
- Reset generation and cause hold
- Standby function (including hardware standby)
- DMA request prohibit
- PLL (multiplier circuit) embedded

(1) Register configuration

- Reset cause register/watchdog cycle control register

Address	bit 15	bit 10	bit 8	bit 0	Initial value	Access

 - : Unused
 X : Indeterminate

(2) Block diagram

13. External Bus Interface

The external bus interface controls the interface between the device and the external memory and also the external I/O, and has the following features.

- 25-bit (32 Mbytes) address output
- 6 independent banks owing to the chip select function.
Can be set to anywhere on the logical address space for minimum unit 64 Kbytes.
Total 32 Mbytes × 6 area setting is available by the address pin and the chip select pin.
- 8/16-bit bus width setting are available for every chip select area.
Areas 6 and 7 allow the inclusive areas to be set.
- Programmable automatic memory wait (max. for 7 cycles) can be inserted.
- DRAM interface support
- Three kinds of DRAM interface: Double CAS DRAM (normally DRAM I/F)
Single CAS DRAM
Hyper DRAM
- 2 banks independent control (RAS, CAS, etc. control signals)
- DRAM select is available from 2CAS/1WE and 1CAS/2WE.
- Hi-speed page mode supported
- CBR/self refresh supported
- Programmable wave form
- Unused address/data pin can be used for I/O port.
- Little endian mode supported
- Clock doubler: Internal bus 50 MHz, external bus 25 MHz

■ ELECTRICAL CHARACTERISTICS

1. Absolute Maximum Ratings

($A_{V_{SS}} = V_{SS} = 0.0 \text{ V}$)

Parameter	Symbol	Value		Unit	Remarks
		Min.	Max.		
Power supply voltage	V_{CC}	$V_{SS} - 0.3$	$V_{SS} + 4.0$	V	*1
Analog supply voltage	$A_{V_{CC}}$	$V_{SS} - 0.3$	$V_{SS} + 4.0$	V	*2
Analog reference voltage	$A_{V_{RH}}$	$V_{SS} - 0.3$	$V_{SS} + 4.0$	V	*2
Input voltage	V_I	$V_{SS} - 0.3$	$V_{CC} + 0.3$	V	
Analog pin input voltage	V_{IA}	$V_{SS} - 0.3$	$A_{V_{CC}} + 0.3$	V	
Output voltage	V_O	$V_{SS} - 0.3$	$V_{CC} + 0.3$	V	
"L" level maximum output current	I_{OL}	—	10	mA	*3
"L" level average output current	I_{OLAV}	—	8	mA	*4
"L" level total maximum output current	ΣI_{OL}	—	100	mA	
"L" level total average output current	ΣI_{OLAV}	—	50	mA	*5
"H" level maximum output current	I_{OH}	—	-10	mA	*3
"H" level average output current	I_{OHAV}	—	-4	mA	*4
"H" level total maximum output current	ΣI_{OH}	—	-50	mA	
"H" level total average output current	ΣI_{OHAV}	—	-20	mA	*5
Power consumption	P_D	—	500	mW	
Operating temperature	T_A	0	+70	°C	
Storage temperature	T_{stg}	-55	+150	°C	

*1 : V_{CC} must not be less than $V_{SS} - 0.3 \text{ V}$.

*2 : Make sure that the voltage does not exceed $V_{CC} + 0.3 \text{ V}$, such as when turning on the device.

*3 : Maximum output current is a peak current value measured at a corresponding pin.

*4 : Average output current is an average current for a 100 ms period at a corresponding pin.

*5 : Average total output current is an average current for a 100 ms period for all corresponding pins.

WARNING: Semiconductor devices can be permanently damaged by application of stress (voltage, current, temperature, etc.) in excess of absolute maximum ratings. Do not exceed these ratings.

2. Recommended Operating Conditions

($AV_{SS} = V_{SS} = 0.0\text{ V}$)

Parameter	Symbol	Value		Unit	Remarks
		Min.	Max.		
Power supply voltage	V_{CC}	3.0	3.6	V	Normal operation
	V_{CC}	3.0	3.6		Retaining the RAM state in stop mode
Analog supply voltage	AV_{CC}	$V_{SS} - 0.3$	$V_{SS} + 3.6$	V	
Analog reference voltage	AV_{RH}	AV_{SS}	AV_{CC}	V	
Operating temperature	T_A	0	+70	°C	

WARNING: The recommended operating conditions are required in order to ensure the normal operation of the semiconductor device. All of the device's electrical characteristics are warranted when the device is operated within these ranges.

Always use semiconductor devices within their recommended operating condition ranges. Operation outside these ranges may adversely affect reliability and could result in device failure.

No warranty is made with respect to uses, operating conditions, or combinations not represented on the data sheet. Users considering application outside the listed conditions are advised to contact their FUJITSU representatives beforehand.

MB91107/108

3. DC Characteristics

($V_{CC} = 3.0\text{ V to }3.6\text{ V}$, $AV_{SS} = V_{SS} = 0.0\text{ V}$, $T_A = 0\text{ }^{\circ}\text{C to }+70\text{ }^{\circ}\text{C}$)

Parameter	Symbol	Pin name	Condition	Value			Unit	Remarks
				Min.	Typ.	Max.		
"H" level input voltage	V_{IH}	Input pin except for hysteresis input	—	$0.7 \times V_{CC}$	—	$V_{CC} + 0.3$	V	
"L" level input voltage	V_{IHS}	*1		$0.8 \times V_{CC}$	—	$V_{CC} + 0.3$	V	Hysteresis input
	V_{IL}	Input pin except for hysteresis input		$V_{SS} - 0.3$	—	$0.25 \times V_{CC}$	V	
	V_{ILS}	*1		$V_{SS} - 0.3$	—	$0.2 \times V_{CC}$	V	Hysteresis input
"H" level output voltage	V_{OH}	All output pins	$V_{CC} = 3.0\text{ V}$ $I_{OH} = -4.0\text{ mA}$	$V_{CC} - 0.5$	—	—	V	
"L" level output voltage	V_{OL}	All output pins	$V_{CC} = 3.0\text{ V}$ $I_{OL} = 8.0\text{ mA}$	—	—	0.4	V	
Input leak current (Hi-Z Output leak current)	I_{LI}	All output pins	$V_{CC} = 3.6\text{ V}$ $0.45\text{ V} < V_I < V_{CC}$	-5	—	+5	μA	
Pull-up resistance	R_{PULL}	\overline{RST}	$V_{CC} = 3.6\text{ V}$ $V_I = 0.45\text{ V}$	12	25	100	$\text{k}\Omega$	
Pull-down resistance	R_{DOWN}	BRQ	$V_{CC} = 3.6\text{ V}$ $V_I = 3.3\text{ V}$	12	25	100	$\text{k}\Omega$	
Power supply current*2	I_{CC}	V_{CC}	$F_C = 12.5\text{ MHz}$ $V_{CC} = 3.3\text{ V}$	—	80	150	mA	(Four multiplication) Operation at 50 MHz
	I_{CCS}		$F_C = 12.5\text{ MHz}$ $V_{CC} = 3.3\text{ V}$	—	40	120	mA	Sleep mode
	I_{CCH}		$T_A = +25\text{ }^{\circ}\text{C}$ $V_{CC} = 3.3\text{ V}$	—	5	—	μA	Stop mode
Input capacitance	C_{IN}	Except for V_{CC} , AV_{CC} , AV_{SS} , V_{SS}	—	—	10	—	pF	

*1 : Hysteresis input pin : \overline{NMI} , \overline{RST} , P40 to P47, P50 to P57, P60 to P67, P70, P81, P85, PA1 to PA6, PB0 to PB7, PE0 to PE7, PF0 to PF7, PG0 to PG7, PH0 to PH7, PIO, PI1

*2 : The MB91V107 (development model) has larger supply current than the production models because it contains an development tool interface circuit.

4. AC Characteristics

•Measurement Conditions

The following conditions applies to measurement items unless otherwise specified.

•AC characteristics measurement conditions

V_{IH}	$1 / 2 \times V_{CC}$	V_{OH}	$1 / 2 \times V_{CC}$
V_{IL}	$1 / 2 \times V_{CC}$	V_{OL}	$1 / 2 \times V_{CC}$

$V_{CC} = 3.0 \text{ V to } 3.6 \text{ V}$

Note: The rise/fall time of input is 10 ns or less.

•Load conditions

MB91107/108

(1) Clock Timings

(V_{CC} = 3.0 V to 3.6 V, AV_{SS} = V_{SS} = 0.0 V, T_A = 0 °C to +70 °C)

Parameter	Symbol	Pin name	Condition	Value		Unit	Remarks
				Min.	Max.		
Clock frequency (1)	F _c	X0 X1	—	12.5	12.5	MHz	Self-oscillation 12.5 MHz Internal operation at 50 MHz (Using PLL, 4 multiplication)
Clock cycle time	t _c	X0 X1		—	80	ns	
Frequency shift ratio *1 (when locked)	Δf	—		—	5	%	
Clock frequency (2)	F _c	X0 X1	—	10	25	MHz	Self-oscillation (divide-by-2 input)
Clock frequency (3)	F _c	X0 X1		10	25	MHz	External clock (divide-by-2 input)
Clock cycle time	t _c	X0 X1		40	100	ns	
Input clock pulse width	P _{WH} P _{WL}	X0 X1	12.5 to 25 MHz	20	—	ns	Input to X0, X1
	P _{WH}	X0	Less than 12.5 MHz	25	—	ns	Input to X0 only
Input clock rising/falling time	t _{CR} t _{CF}	X0 X1	—	—	8	ns	(t _{CR} + t _{CF})
	Internal operating clock frequency	f _{CP} f _{CPP}	—	0.625 × 2	50	MHz	CPU system
	f _{CP} f _{CPP}	0.625 × 2		25	MHz	Peripheral system	
Internal operating clock cycle time	t _{CP}	—		20	1600*2	ns	CPU system
	t _{CPP}	—		40	1600*2	ns	Peripheral system

*1 : Frequency shift ratio stands for deviation ratio of the operating clock from the center frequency in the clock multiplication system.

*2 : These values are for a minimum clock of 10 MHz input to X0, a divide-by-2 system of the source oscillation and a 1/8 gear.

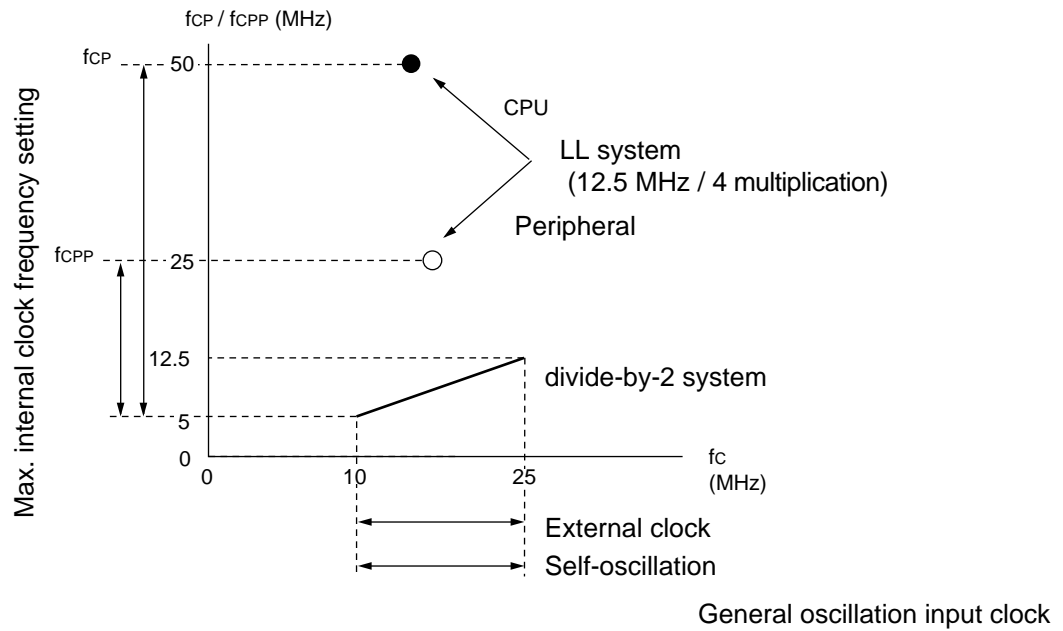

• Clock timing rating measurement conditions

• Operation warranty range

• External / internal clock setting range

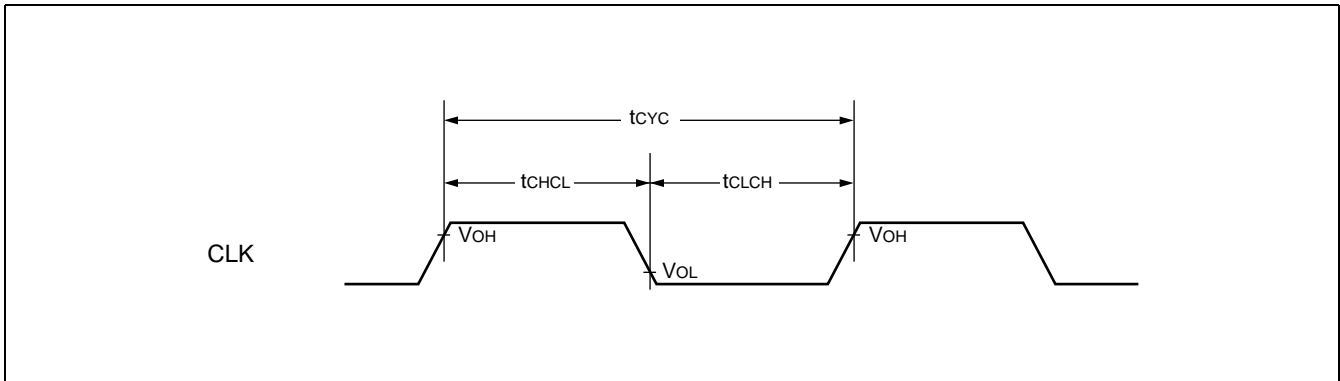

- Note:
- When using PLL, the external clock must be used need 12.5 MHz.
 - PLL oscillation stabilizing period > 100 μs
 - The setting of internal clock must be within above ranges.

(2) Clock Output Timing

($V_{CC} = 3.0\text{ V to }3.6\text{ V}$, $A_{V_{SS}} = V_{SS} = 0.0\text{ V}$, $T_A = 0\text{ }^{\circ}\text{C to }+70\text{ }^{\circ}\text{C}$)

Parameter	Symbol	Pin name	Condition	Value		Unit	Remarks
				Min.	Max.		
Cycle time	t_{CYC}	CLK	—	t_{CP}	—	ns	*1
				$2 \times t_{CP}$	—		Using the doubler
CLK \uparrow →CLK \downarrow	t_{CHCL}	CLK	—	$1/2 \times t_{CYC} - 10$	$1/2 \times t_{CYC} + 10$	ns	*2
CLK \downarrow →CLK \uparrow	t_{CLCH}	CLK	—	$1/2 \times t_{CYC} - 10$	$1/2 \times t_{CYC} + 10$	ns	*3

*1 : t_{CYC} is a frequency for 1 clock cycle including a gear cycle.

*2 : Rating at a gear cycle of $\times 1$.

When a gear cycle of 1/2, 1/4, 1/8 is selected, substitute "n" in the following equations with 1/2, 1/4, 1/8, respectively.

$$\text{Min. : } (1 - n/2) \times t_{CYC} - 10$$

$$\text{Max. : } (1 - n/2) \times t_{CYC} + 10$$

Select a gear cycle of $\times 1$ when using the doubler.

*3 : Rating at a gear cycle of $\times 1$.

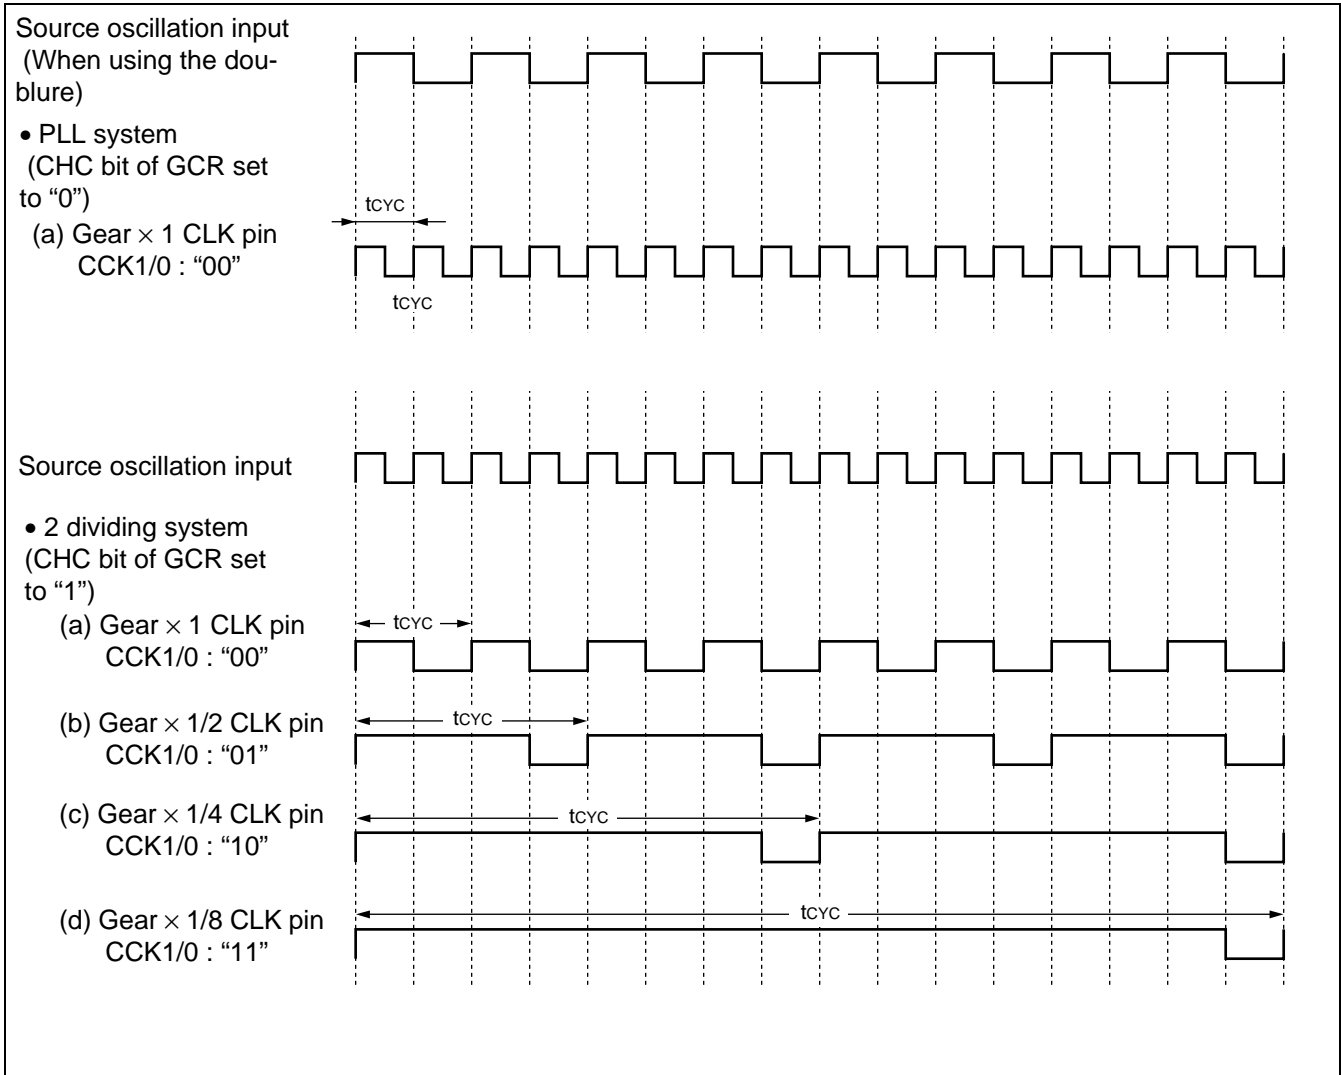

When a gear cycle of 1/2, 1/4, 1/8 is selected, substitute "n" in the following equations with 1/2, 1/4, 1/8, respectively.

$$\text{Min.: } n/2 \times t_{CYC} - 10$$

$$\text{Max.: } n/2 \times t_{CYC} + 10$$

Select a gear cycle of $\times 1$ when using the doubler.

The relation between source oscillation input and CLK pin for configured by CHC/CCK1/CCK0 settings of GCR (gear control register) is as follows. However, in this chart source oscillation input means X0 input clock.

MB91107/108

(3) Reset Input Ratings

($V_{CC} = 3.0\text{ V to }3.6\text{ V}$, $A V_{SS} = V_{SS} = 0.0\text{ V}$, $T_A = 0\text{ }^{\circ}\text{C to }+70\text{ }^{\circ}\text{C}$)

Parameter	Symbol	Pin name	Condition	Value		Unit	Remarks
				Min.	Max.		
Reset input time	t_{RSTL}	\overline{RST}	—	$t_{CP} \times 5$	—	ns	

(4) Power-on Reset

($V_{CC} = 3.0\text{ V to }3.6\text{ V}$, $A_{V_{SS}} = V_{SS} = 0.0\text{ V}$, $T_A = 0\text{ }^{\circ}\text{C to }+70\text{ }^{\circ}\text{C}$)

Parameter	Symbol	Pin name	Condition	Value		Unit	Remarks
				Min.	Max.		
Power supply rising time	t_R	V_{CC}	$V_{CC} = 3.3\text{ V}$	—	18	ms	$V_{CC} < 0.2\text{ V}$ before the power supply rising
Power supply shut off time	t_{OFF}	V_{CC}	—	1	—	ms	Repeated operations
Oscillation stabilizing time	t_{OSC}	—	—	$2 \times t_c \times 2^{20} + 100\text{ }\mu\text{s}$	—	ns	

•Notes

- 1) Sudden change in supply voltage during operation may initiate a power-on sequence. To change supply voltage during operation, it is recommended to smoothly raise the voltage to avoid rapid fluctuations in the supply voltage.

- 2) Set $\overline{\text{RST}}$ pin to "L" level when turning on the device, at least the t_{RSTL} duration after the supply voltage reaches V_{CC} is necessary before turning the $\overline{\text{RST}}$ to "H" level.

- 3) If the supply voltage goes below the lower limit of the guaranteed operating voltage range, be sure to restart the power supply from the V_{SS} level. This is because an internal power-on reset must be generated to restart operation without allowing the internal circuit to run out of control.
The guaranteed operating voltage range of MB91107 is from 3.0 to 3.6 V.

(5) Normal Bus Access Read/write Operation

($V_{CC} = 3.0\text{ V to }3.6\text{ V}$, $AV_{SS} = V_{SS} = 0.0\text{ V}$, $T_A = 0\text{ }^\circ\text{C to }+70\text{ }^\circ\text{C}$)

Parameter	Symbol	Pin name	Condition	Value		Unit	Remarks
				Min.	Max.		
$\overline{CS0}$ to $\overline{CS7}$ delay time	t_{CHCSL}	CLK	—	—	15	ns	
$\overline{CS0}$ to $\overline{CS7}$ delay time	t_{CHCSH}	$\overline{CS0}$ to $\overline{CS7}$		—	15	ns	
Address delay time	t_{CHAV}	CLK A24 to A00		—	15	ns	
Data delay time	t_{CHDV}	CLK D31 to D16		—	15	ns	
\overline{RD} delay time	$t_{CLR L}$	CLK		—	15	ns	
\overline{RD} delay time	$t_{CLR H}$	\overline{RD}		—	15	ns	
$\overline{WR0}$, $\overline{WR1}$ delay time	t_{CLWL}	CLK		—	15	ns	
$\overline{WR0}$, $\overline{WR1}$ delay time	t_{CLWH}	$\overline{WR0}$ to $\overline{WR1}$		—	15	ns	
Valid address → valid data input time	t_{AVDV}	A24 to A00 D31 to D16		—	$3/2 \times t_{CYC} - 25$	ns	*1 *2
$\overline{RD} \downarrow \rightarrow$ valid data input time	t_{RLDV}	\overline{RD} D31 to D16		—	$t_{CYC} - 10$	ns	*1
Data set up → $\overline{RD} \uparrow$ time	t_{DSRH}			10	—	ns	
$\overline{RD} \uparrow \rightarrow$ data hold time	t_{RHDX}			0	—	ns	

*1: When bus timing is delayed by automatic wait insertion or RDY input, add ($t_{CYC} \times$ extended cycle number for delay) to this rating.

*2: Rating at a gear cycle of $\times 1$.

When a gear cycle of 1/2, 1/4, 1/8 is selected, substitute “n” in the following equation with 1/2, 1/4, 1/8, respectively.

$$\text{Equation: } (2 - n/2) \times t_{CYC} - 25$$

MB91107/108

(6) Ready Input Timing

($V_{CC} = 3.0\text{ V to }3.6\text{ V}$, $AV_{SS} = V_{SS} = 0.0\text{ V}$, $T_A = 0\text{ }^{\circ}\text{C to }+70\text{ }^{\circ}\text{C}$)

Parameter	Symbol	Pin name	Condition	Value		Unit	Remarks
				Min.	Max.		
RDY set up time → CLK ↓	t_{RDYS}	RDY CLK	—	15	—	ns	
CLK ↓ → RDY hold time	t_{RDYH}	CLK RDY		0	—	ns	

(7) Hold Timing

($V_{CC} = 3.0\text{ V to }3.6\text{ V}$, $A_{V_{SS}} = V_{SS} = 0.0\text{ V}$, $T_A = 0\text{ }^{\circ}\text{C to }+70\text{ }^{\circ}\text{C}$)

Parameter	Symbol	Pin name	Condition	Value		Unit	Remarks
				Min.	Max.		
BGRNT delay time	t_{CHBGL}	CLK BGRNT	—	—	6	ns	
BGRNT delay time	t_{CHBGH}			—	6	ns	
Pin floating \rightarrow BGRNT \downarrow time	t_{XHAL}	BGRNT	—	$t_{CYC} - 10$	$t_{CYC} + 10$	ns	
BGRNT \uparrow \rightarrow pin valid time	t_{HAHV}			$t_{CYC} - 10$	$t_{CYC} + 10$	ns	

Note : There is a delay time of more than 1 cycle from BRQ input to BGRNT change.

MB91107/108

(8) Normal DRAM Mode Read/Write Cycle

($V_{CC} = 3.0\text{ V to }3.6\text{ V}$, $AV_{SS} = V_{SS} = 0.0\text{ V}$, $T_A = 0\text{ }^\circ\text{C to }+70\text{ }^\circ\text{C}$)

Parameter	Symbol	Pin name	Condi- tion	Value		Unit	Remarks
				Min.	Max.		
RAS delay time	t_{CLRAH}	CLK RAS	—	—	15	ns	
RAS delay time	t_{CHRAL}			—	15	ns	
CAS delay time	t_{CLCASL}	CLK CAS		—	15	ns	
CAS delay time	t_{CLCASH}			—	15	ns	
ROW address delay time	t_{CHRAV}	CLK A24 to A00		—	15	ns	
COLUMN address delay time	t_{CHCAV}			—	15	ns	
\overline{DW} delay time	t_{CHDWL}	CLK \overline{DW}		—	15	ns	
\overline{DW} delay time	t_{CHDWH}			—	15	ns	
Output data delay time	t_{CHDV1}	CLK D31 to D16		—	15	ns	
RAS $\downarrow \rightarrow$ valid data input time	t_{RLDV}	RAS D31 to D16		—	$5 / 2 \times t_{CYC} - 16$	ns	*1 *2
CAS $\downarrow \rightarrow$ valid data input time	t_{CLDV}	CAS		—	$t_{CYC} - 17$	ns	*1
CAS $\uparrow \rightarrow$ data hold time	t_{CADH}	D31 to D16		0	—	ns	

*1 : When Q1 cycle or Q4 cycle is extended for 1 cycle, add t_{CYC} time to this rating.

*2 : Rating at a gear cycle of $\times 1$.

When a gear cycle of 1/2, 1/4, 1/8 is selected, substitute "n" in the following equation with 1/2, 1/4, 1/8, respectively.

•Equation: $(3 - n/2) \times t_{CYC} - 16$

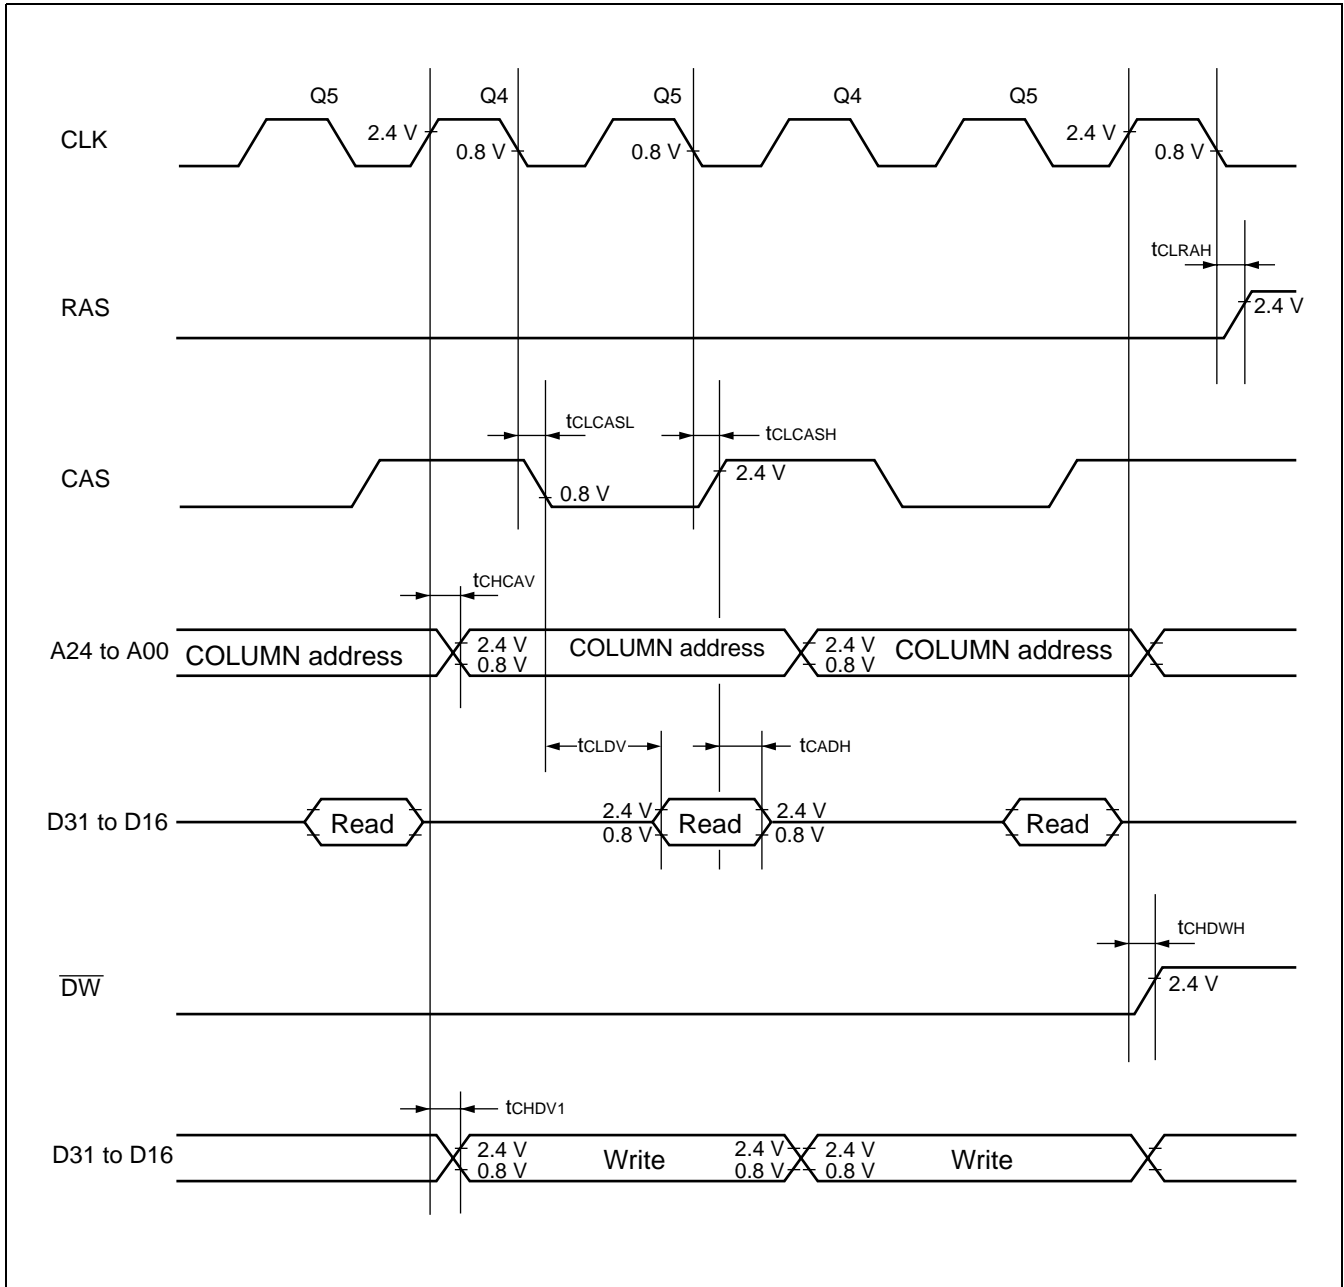

MB91107/108

(9) Normal DRAM Mode Fast Page Read/Write Cycle

($V_{CC} = 3.0\text{ V to }3.6\text{ V}$, $A_{VSS} = V_{SS} = 0.0\text{ V}$, $T_A = 0\text{ }^{\circ}\text{C to }+70\text{ }^{\circ}\text{C}$)

Parameter	Symbol	Pin name	Condi- tion	Value		Unit	Remarks
				Min.	Max.		
RAS delay time	t_{CLRAH}	CLK, RAS	—	—	15	ns	
CAS delay time	t_{CLCASL}	CLK		—	15	ns	
CAS delay time	t_{CLCASH}	CAS		—	15	ns	
COLUMN address delay time	t_{CHCAV}	CLK A24 to A00		—	15	ns	
\overline{DW} delay time	t_{CHDWH}	CLK, \overline{DW}		—	15	ns	
Output data delay time	t_{CHDV1}	CLK D31 to D16		—	15	ns	
CAS $\downarrow \rightarrow$ valid data input time	t_{CLDV}	CAS		—	$t_{CYC} - 17$	ns	*
CAS $\uparrow \rightarrow$ data hold time	t_{CADH}	D31 to D16		0	—	ns	

* : When Q4 cycle is extended for 1 cycle, add t_{CYC} time to this rating.

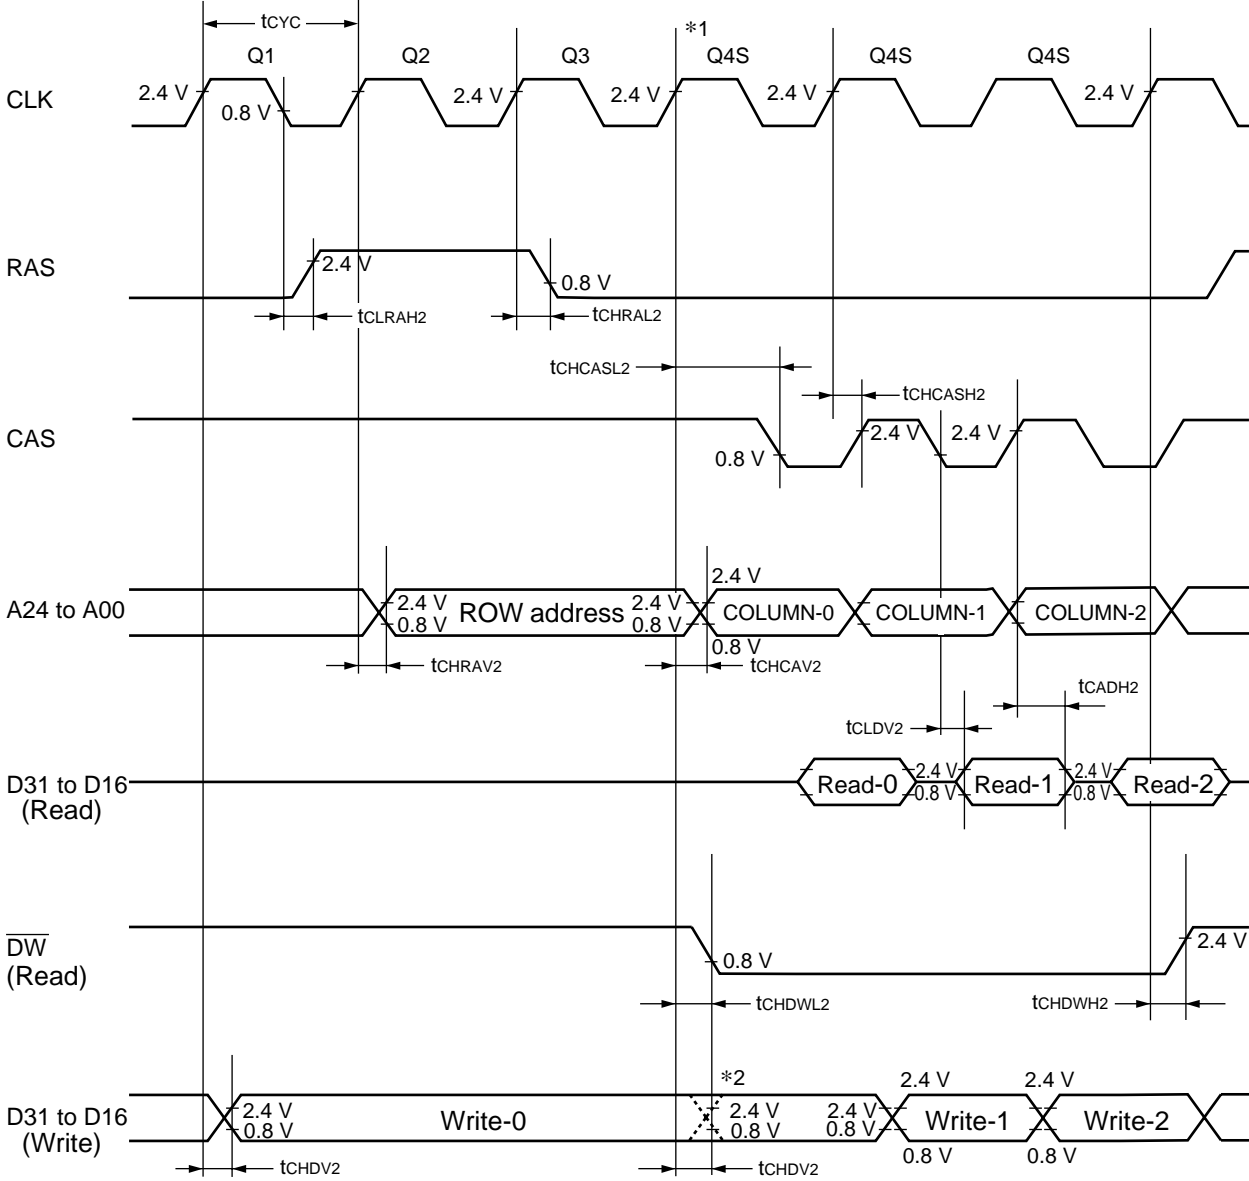

MB91107/108

(10) Single DRAM Timing

($V_{CC} = 3.0\text{ V to }3.6\text{ V}$, $AV_{SS} = V_{SS} = 0.0\text{ V}$, $T_A = 0\text{ }^{\circ}\text{C to }+70\text{ }^{\circ}\text{C}$)

Parameter	Symbol	Pin name	Condi- tion	Value		Unit	Remarks
				Min.	Max.		
RAS delay time	t_{CLRAH2}	CLK RAS	—	—	15	ns	
RAS delay time	t_{CHRAL2}			—	15	ns	
CAS delay time	$t_{CHCASL2}$	CLK CAS		—	$n/2 \times t_{CYC}$ + $t_{CHCASH2}$	ns	
CAS delay time	$t_{CHCASH2}$			—	15	ns	
ROW address delay time	t_{CHRAV2}	CLK A24 to A00		—	15	ns	
COLUMN address delay time	t_{CHCAV2}			—	15	ns	
\overline{DW} delay time	t_{CHDWL2}	CLK \overline{DW}		—	15	ns	
\overline{DW} delay time	t_{CHDWH2}			—	15	ns	
Output data delay time	t_{CHDV2}	CLK, D31 to D16		—	15	ns	
CAS $\downarrow \rightarrow$ Valid data input time	t_{CLDV2}	CAS D31 to D16		—	$(1 - n/2) \times t_{CYC}$ - 17	ns	
CAS $\uparrow \rightarrow$ data hold time	t_{CADH2}		0	—	ns		

*1 : Q4S indicates Q4SR (Read) of Single DRAM cycle or Q4SW (Write) cycle.

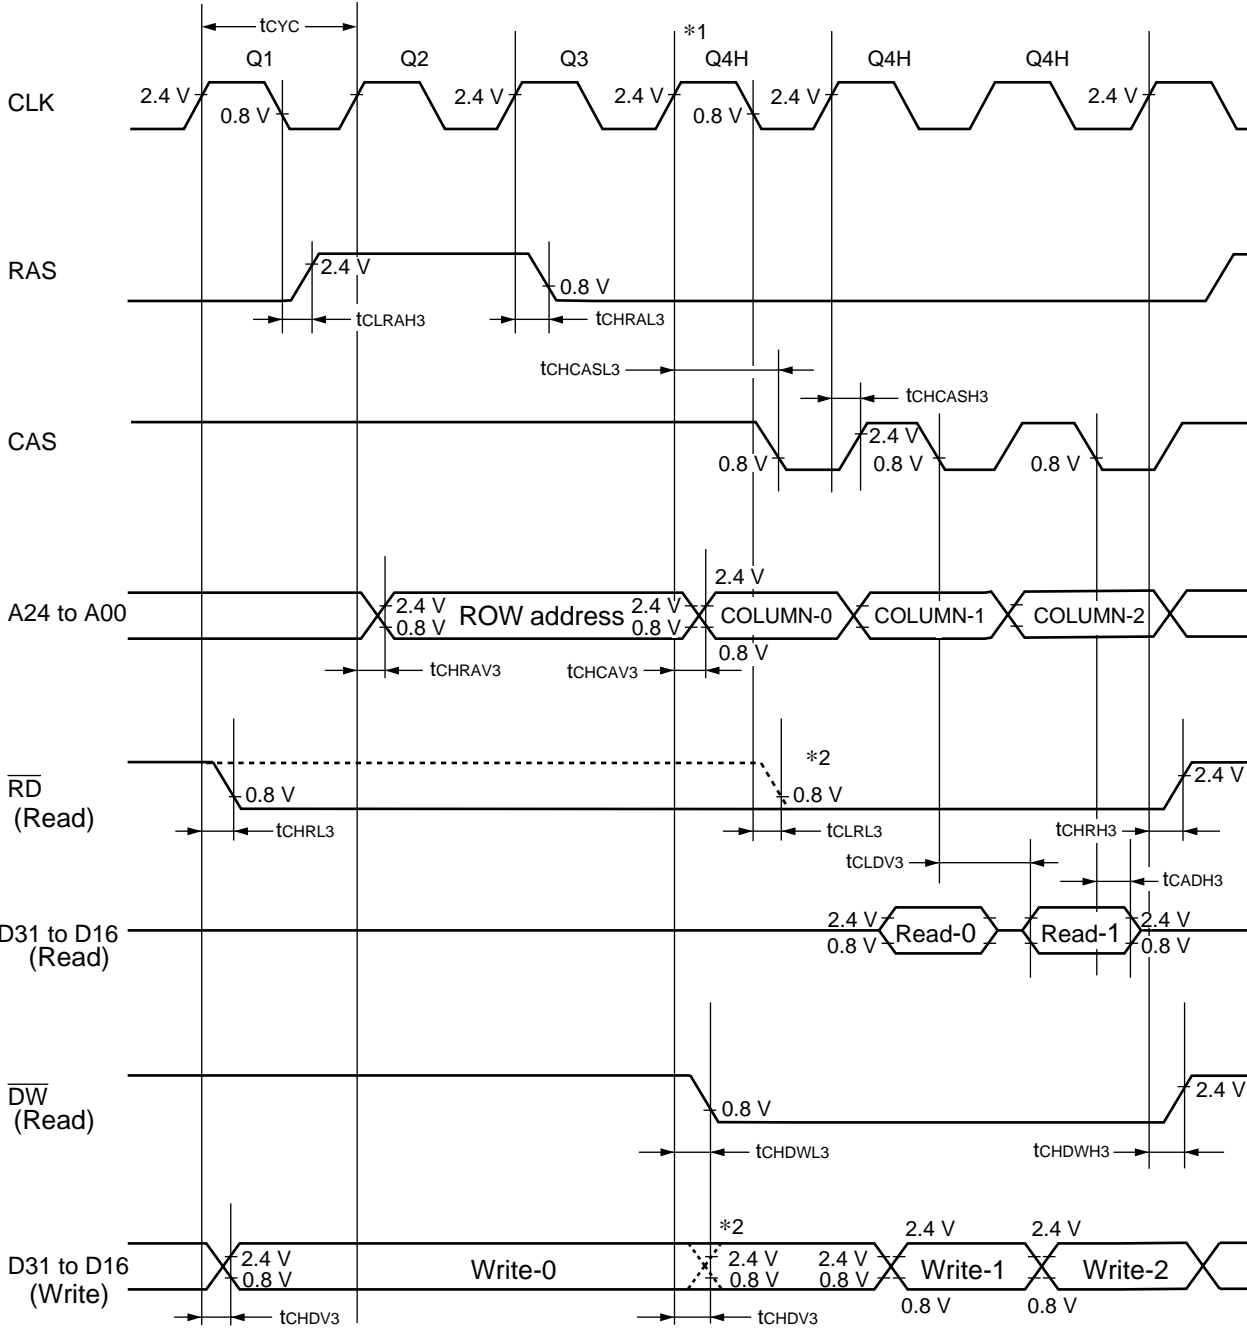

*2 : indicates the timing when the bus cycle begins from the high speed page mode.

MB91107/108

(11) Hyper DRAM Timing

($V_{CC} = 3.0\text{ V to } 3.6\text{ V}$, $AV_{SS} = V_{SS} = 0.0\text{ V}$, $T_A = 0\text{ }^{\circ}\text{C to } +70\text{ }^{\circ}\text{C}$)

Parameter	Symbol	Pin name	Condition	Value		Unit	Remarks
				Min.	Max.		
RAS delay time	t_{CLRAH3}	CLK RAS	—	—	15	ns	
RAS delay time	t_{CHRAL3}			—	15	ns	
CAS delay time	$t_{CHCASL3}$	CLK CAS		—	$n/2 \times t_{CYC}$ + $t_{CHCASH3}$	ns	
CAS delay time	$t_{CHCASH3}$			—	15	ns	
ROW address delay time	t_{CHRAV3}	CLK A24 to A00		—	15	ns	
COLUMN address delay time	t_{CHCAV3}			—	15	ns	
\overline{RD} delay time	t_{CHRL3}	CLK \overline{RD}		—	15	ns	
\overline{RD} delay time	t_{CHRH3}			—	15	ns	
\overline{RD} delay time	t_{CLRL3}			—	15	ns	
\overline{DW} delay time	t_{CHDWL3}	CLK \overline{DW}		—	15	ns	
\overline{DW} delay time	t_{CHDWH3}			—	15	ns	
Output data delay time	t_{CHDV3}	CLK D31 to D16		—	15	ns	
CAS $\downarrow \rightarrow$ valid data input time	t_{CLDV3}	CAS D31 to D16		—	$t_{CYC} - 17$	ns	
CAS $\downarrow \rightarrow$ data hold time	t_{CADH3}			0	—	ns	

MB91107/108

(12) CBR Refresh

($V_{CC} = 3.0\text{ V to }3.6\text{ V}$, $A_{V_{SS}} = V_{SS} = 0.0\text{ V}$, $T_A = 0\text{ }^{\circ}\text{C to }+70\text{ }^{\circ}\text{C}$)

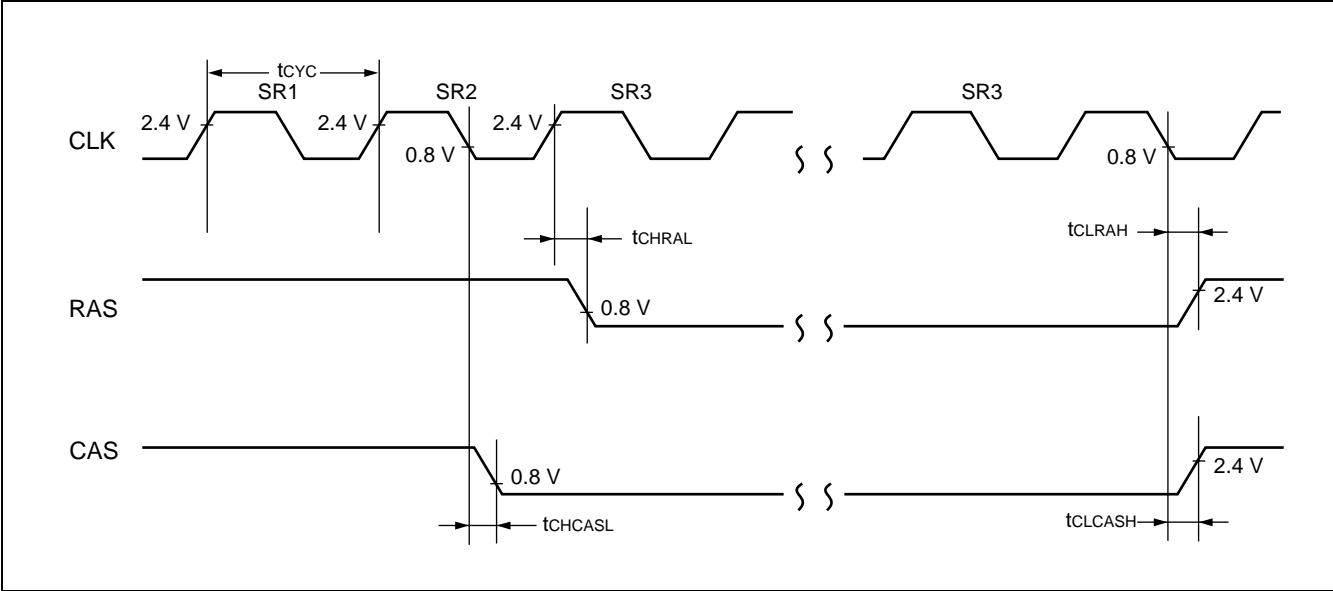

Parameter	Symbol	Pin name	Condition	Value		Unit	Remarks
				Min.	Max.		
RAS delay time	t_{CLRAH}	CLK RAS	—	—	15	ns	
RAS delay time	t_{CHRAL}			—	15	ns	
CAS delay time	t_{CLCASL}	CLK CAS	—	—	15	ns	
CAS delay time	t_{CLCASH}			—	15	ns	

(13) Self Refresh

(V_{CC} = 3.0 V to 3.6 V, AV_{SS} = V_{SS} = 0.0 V, T_A = 0 °C to +70 °C)

Parameter	Symbol	Pin name	Condi- tion	Value		Unit	Remarks
				Min.	Max.		
RAS delay time	t _{CLRAH}	CLK RAS	—	—	15	ns	
RAS delay time	t _{CHRAL}			—	15	ns	
CAS delay time	t _{CLCASL}	CLK CAS		—	15	ns	
CAS delay time	t _{CLCASH}			—	15	ns	

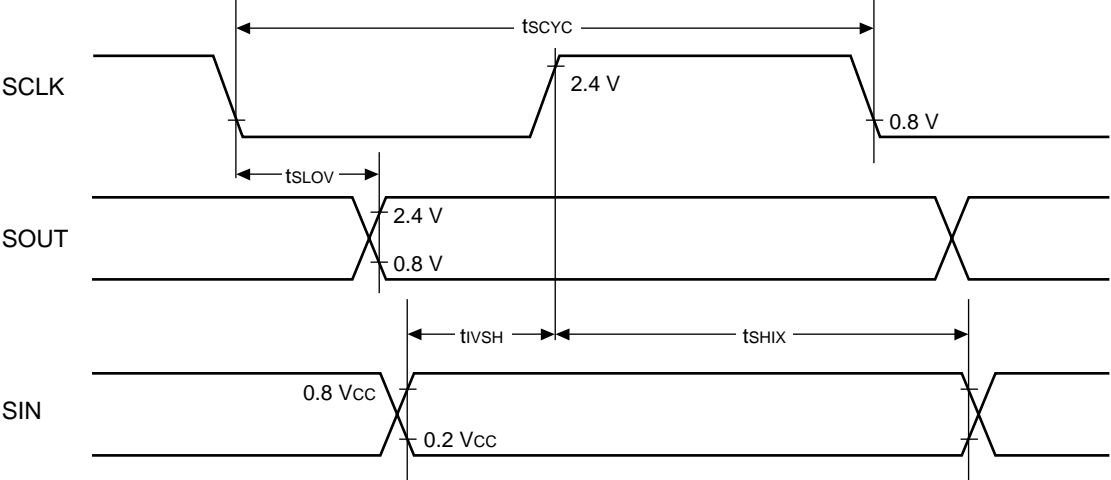

(14) UART Timing

($V_{CC} = 3.0\text{ V to }3.6\text{ V}$, $A_{V_{SS}} = V_{SS} = 0.0\text{ V}$, $T_A = 0\text{ }^{\circ}\text{C to }+70\text{ }^{\circ}\text{C}$)

Parameter	Symbol	Pin name	Condition	Value		Unit	Remarks
				Min.	Max.		
Serial clock cycle time	t _{SCYC}	—	Internal shift clock mode	8 t _{CYCP}	—	ns	
SCLK ↓→ SOUT delay time	t _{SLOV}	—		-80	80	ns	
Valid SIN → SCLK ↑	t _{IVSH}	—		100	—	ns	
SCLK ↑→ valid SIN hold time	t _{SHIX}	—		60	—	ns	
Serial clock "H" pulse width	t _{SHSL}	—	External shift clock mode	4 t _{CYCP}	—	ns	
Serial clock "L" pulse width	t _{SLSH}	—		4 t _{CYCP}	—	ns	
SCLK ↓→ SOUT delay time	t _{SLOV}	—		—	150	ns	
Valid SIN → SCLK ↑	t _{IVSH}	—		60	—	ns	
SCLK ↑→ valid SIN hold time	t _{SHIX}	—		60	—	ns	

- Notes:
- This rating is for AC characteristics in CLK synchronous mode.
 - t_{CYCP}: A cycle time of peripheral system clock

• Internal shift clock mode

• External shift clock mode

MB91107/108

(15) Trigger System Input Timing to

($V_{CC} = 3.0\text{ V to }3.6\text{ V}$, $AV_{SS} = V_{SS} = 0.0\text{ V}$, $T_A = 0\text{ }^{\circ}\text{C to }+70\text{ }^{\circ}\text{C}$)

Parameter	Symbol	Pin name	Condition	Value		Unit	Remarks
				Min.	Max.		
A/D start trigger input time	t_{ATGX}	\overline{ATG}	—	$5 t_{CYCP}$	—	ns	
PPG start trigger input time	t_{PTGR}	TRG0 to TRG3	—	$5 t_{CYCP}$	—	ns	

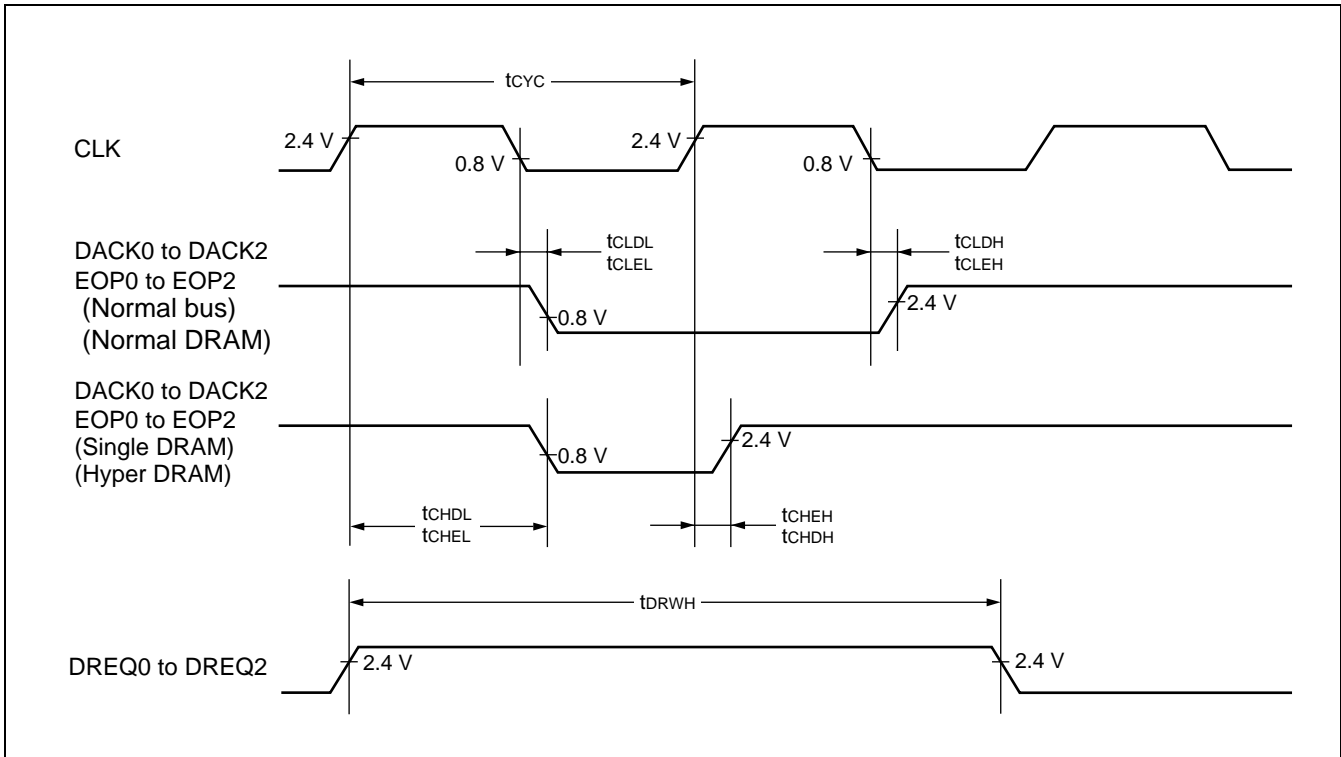

Note : t_{CYCP} : A cycle time of peripheral system clock

(16) DMA Controller Timing

($V_{CC} = 3.0\text{ V to }3.6\text{ V}$, $AV_{SS} = V_{SS} = 0.0\text{ V}$, $T_A = 0\text{ }^{\circ}\text{C to }+70\text{ }^{\circ}\text{C}$)

Parameter	Symbol	Pin name	Condition	Value		Unit	Remarks
				Min.	Max.		
DREQ input pulse width	t_{DRWH}	DREQ0 to DREQ2	—	$2 t_{CYC}$	—	ns	
DACK delay time (Normal bus) (Normal DRAM)	t_{CLDL}	CLK DACK0 to DACK2		—	6	ns	
	t_{CLDH}	DACK0 to DACK2		—	6	ns	
EOP delay time (Normal bus) (Normal DRAM)	t_{CLEL}	CLK EOP0 to EOP2		—	6	ns	
	t_{CLEH}	EOP0 to EOP2		—	6	ns	
DACK delay time (Single DRAM) (Hyper DRAM)	t_{CHDL}	CLK DACK0 to DACK2		—	$n / 2 \times t_{CYC}$	ns	
	t_{CHDH}	DACK0 to DACK2		—	6	ns	
EOP delay time (Single DRAM) (Hyper DRAM)	t_{CHEL}	CLK EOP0 to EOP2		—	$n / 2 \times t_{CYC}$	ns	
	t_{CHEH}	EOP0 to EOP2		—	6	ns	

5. A/D Converter Block Electrical Characteristics

($AV_{CC} = V_{CC} = +3.0\text{ V to }+3.6\text{ V}$, $AV_{SS} = V_{SS} = 0.0\text{ V}$, $AV_{RH} = +3.0\text{ V to }+3.6\text{ V}$, $T_A = 0\text{ }^{\circ}\text{C to }+70\text{ }^{\circ}\text{C}$)

Parameter	Symbol	Pin name	Value			Unit
			Min.	Typ.	Max.	
Resolution	—	—	—	10	10	bit
Total error	—	—	—	—	± 4.0	LSB
Linearity error	—	—	—	—	± 3.0	LSB
Differentiation linearity error	—	—	—	—	± 2.5	LSB
Zero transition voltage	V_{OT}	AN0 to AN3	-1.5	+0.5	+2.5	LSB
Full-scale transition voltage	V_{FST}	AN0 to AN3	$AV_{RH} - 4.5$	$AV_{RH} - 1.5$	$AV_{RH} + 0.5$	LSB
Conversion time	—	—	5.6^{*1}	—	—	μs
Analog port input current	I_{AIN}	AN0 to AN3	—	0.1	10	μA
Analog input voltage	V_{AIN}	AN0 to AN3	AV_{SS}	—	AV_{RH}	V
Reference voltage	—	AV_{RH}	AV_{SS}	—	AV_{CC}	V
Power supply current	I_A	AV_{CC}	—	500	—	μA
	I_{AH}		—	—	5^{*2}	μA
Reference voltage supply current	I_R	AV_{RH}	—	500	—	μA
	I_{RH}		—	—	5^{*2}	μA
Conversion variance between channels	—	AN0 to AN3	—	—	4	LSB

*1: $AV_{CC} = V_{CC} = 3.0\text{ V to }3.6\text{ V}$ (for a machine clock of 25 MHz).

*2: Current value for A/D converters not in operation, CPU stop mode ($V_{CC} = AV_{CC} = AV_{RH} = 3.6\text{ V}$)

- Notes:
- As the absolute value of AV_{RH} decreases, relative error increases.
 - Output impedance of external circuit of analog input under following conditions;
Output impedance of external circuit $< 7\text{ k}\Omega$.
If output impedance of external circuit is too high, analog voltage sampling time may be too short for accurate sampling.

6. A/D Converter Glossary

- Resolution
The smallest change in analog voltage detected by A/D converter.
- Linearity error
A deviation of actual conversion characteristic from a line connecting the zero-traction point (between “00 0000 0000” ↔ “00 0000 0001”) to the full-scale transition point (between “11 1111 1110” ↔ “11 1111 1111”).
- Differential linearity error
A deviation of a step voltage for changing the LSB of output code from ideal input voltage

$$\text{Linearity error of digital output } N = \frac{V_{NT} - \{1 \text{ LSB} \times (N - 1) + V_{OT}\}}{1 \text{ LSB}} \quad [\text{LSB}]$$

$$\text{Differential linearity error of digital output } N = \frac{V_{(N+1)T} - V_{NT}}{1 \text{ LSB}} - 1 \quad [\text{LSB}]$$

$$1 \text{ LSB} = \frac{V_{FST} - V_{OT}}{1022} \quad [\text{V}]$$

$$1 \text{ LSB (Ideal value)} = \frac{AVRH - AVRL}{1024} \quad [\text{V}]$$

V_{OT} : A voltage for causing transition of digital output from (000)_H to (001)_H

V_{FST} : A voltage for causing transition of digital output from (3FE)_H to (3FF)_H

V_{NT} : A voltage for causing transition of digital output from (N - 1) to N

- Total error

A difference between actual value and theoretical value. The overall error includes zero-transition error, full-scale transition error and linearity error.

$$\text{Total error of digital output } N = \frac{V_{NT} - \{1 \text{ LSB} \times (N - 1) + 0.5 \text{ LSB}\}}{1 \text{ LSB}} \text{ [LSB]}$$

$$V_{OT} \text{ (Ideal value)} = AVRL + 0.5 \text{ LSB [V]}$$

$$V_{FST} \text{ (Ideal value)} = AVRH - 1.5 \text{ LSB [V]}$$

V_{NT} : A voltage for causing transition of digital output from (N - 1) to N

■ REFERENCE DATA

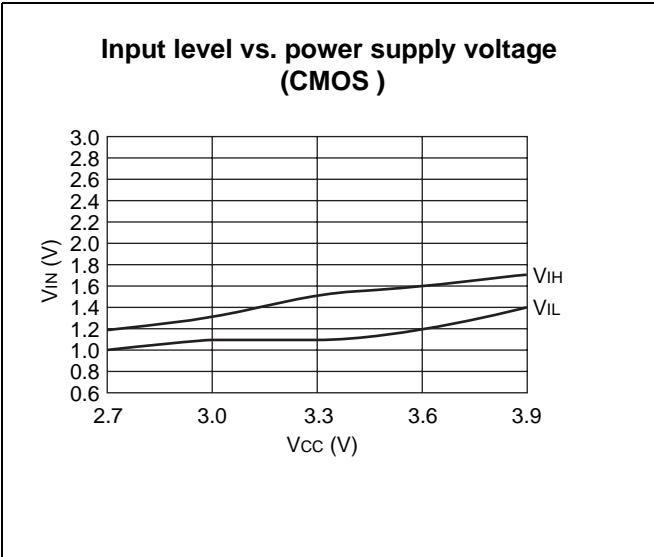

(1) "H" level output voltage

(2) "L" level output voltage

(3) "H" level input / "L" level input voltage (CMOS input)

(4) "H" level input / "L" level input voltage (Hysteresys input)

(5) Power supply current

Power supply current vs. voltage

Power supply current (sleep mode) vs. power supply current

Power supply current (stop mode) vs. power supply voltage

A/D conversion block Power supply current vs. power supply voltage (25 MHz)

A/D conversion block reference voltage supply current vs. voltage (25 MHz)

(6) Pull-up / pull-down resistance

Pull-down resistance vs. power supply voltage

Pull-up resistance vs. power supply voltage

■ INSTRUCTIONS (165 INSTRUCTIONS)

1. How to Read Instruction Set Summary

Mnemonic	Type	OP	CYC	NZVC	Operation	Remarks
ADD Rj, Ri	A	A6	1	CCCC	$R_i + R_j \rightarrow R_i$	
* ADD #s5, Ri	C	A4	1	CCCC	$R_i + s5 \rightarrow R_i$	
,	,	,	,	,	,	
,	,	,	,	,	,	
↓	↓	↓	↓	↓	↓	
(1)	(2)	(3)	(4)	(5)	(6)	(7)

(1) Names of instructions

Instructions marked with * are not included in CPU specifications. These are extended instruction codes added/extended at assembly language levels.

(2) Addressing modes specified as operands are listed in symbols.
Refer to "2. Addressing mode symbols" for further information.

(3) Instruction types

(4) Hexa-decimal expressions of instructions

(5) The number of machine cycles needed for execution

a: Memory access cycle and it has possibility of delay by Ready function.

b: Memory access cycle and it has possibility of delay by Ready function.

If an object register in a LD operation is referenced by an immediately following instruction, the interlock function is activated and number of cycles needed for execution increases.

c: If an immediately following instruction operates to an object of R15, SSP or USP in read/write mode or if the instruction belongs to instruction format A group, the interlock function is activated and number of cycles needed for execution increases by 1 to make the total number of 2 cycles needed.

d: If an immediately following instruction refers to MDH/MDL, the interlock function is activated and number of cycles needed for execution increases by 1 to make the total number of 2 cycles needed.

For a, b, c and d, minimum execution cycle is 1.

(6) Change in flag sign

- Flag change

C : Change

– : No change

0 : Clear

1 : Set

- Flag meanings

N : Negative flag

Z : Zero flag

V : Over flag

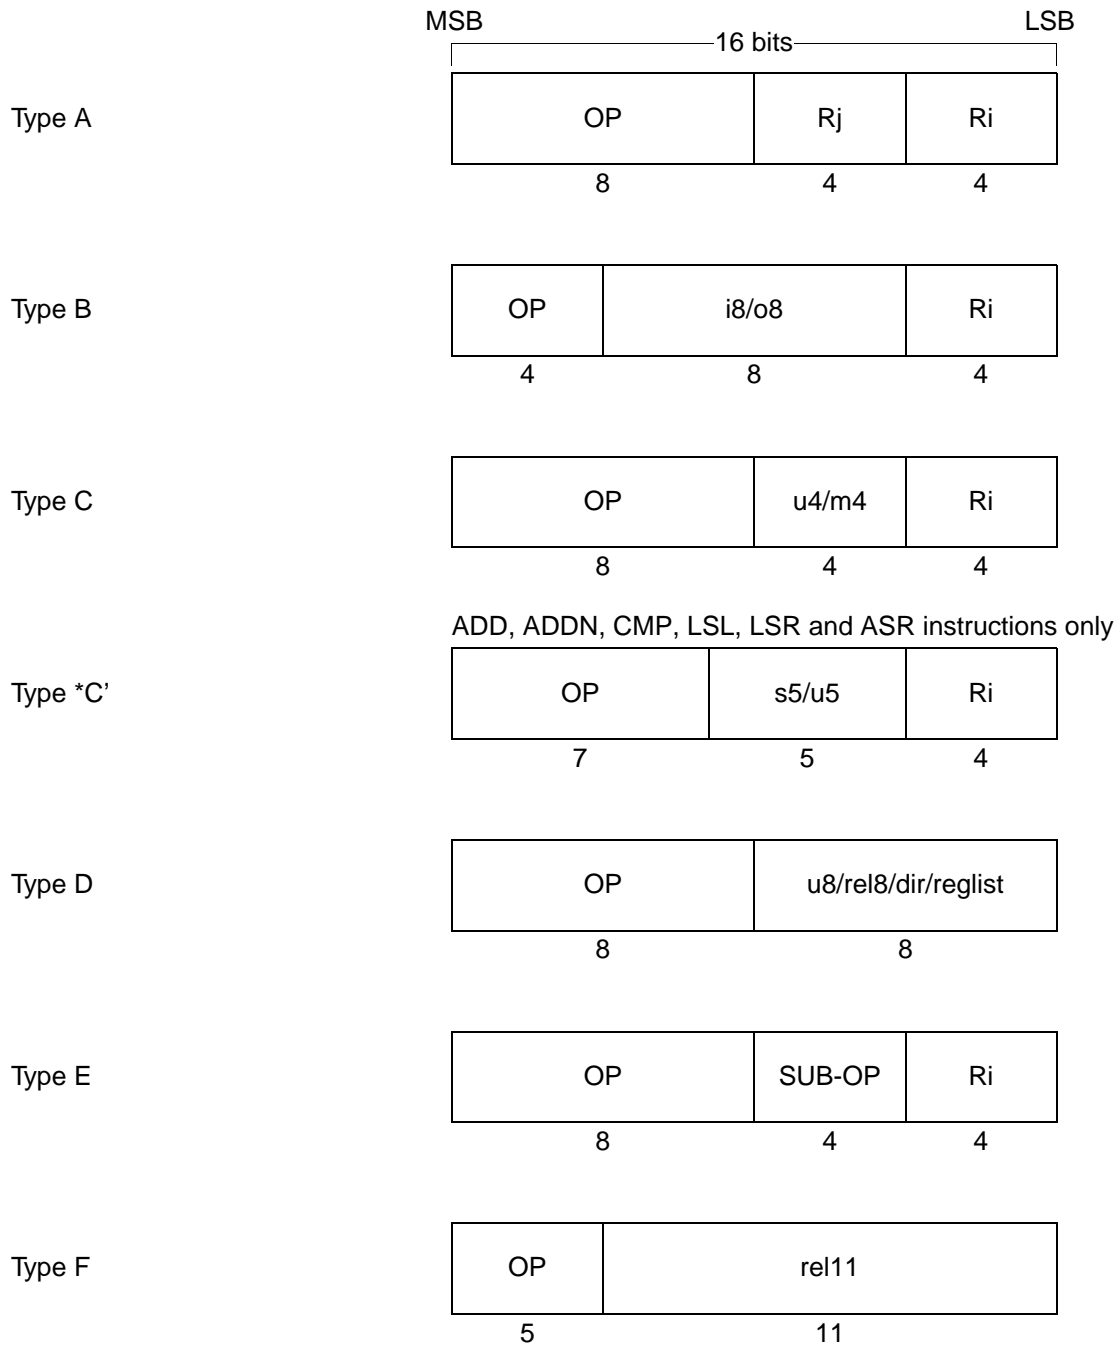

C : Carry flag

(7) Operation carried out by instruction

2. Addressing Mode Symbols

Ri	: Register direct (R0 to R15, AC, FP, SP)
Rj	: Register direct (R0 to R15, AC, FP, SP)
R13	: Register direct (R13, AC)
Ps	: Register direct (Program status register)
Rs	: Register direct (TBR, RP, SSP, USP, MDH, MDL)
CRi	: Register direct (CR0 to CR15)
CRj	: Register direct (CR0 to CR15)
#i8	: Unsigned 8-bit immediate (–128 to 255) Note: –128 to –1 are interpreted as 128 to 255
#i20	: Unsigned 20-bit immediate (–0X80000 to 0XFFFFFF) Note: –0X7FFFF to –1 are interpreted as 0X7FFFF to 0XFFFFFF
#i32	: Unsigned 32-bit immediate (–0X80000000 to 0xFFFFFFFF) Note: –0X80000000 to –1 are interpreted as 0X80000000 to 0xFFFFFFFF
#s5	: Signed 5-bit immediate (–16 to 15)
#s10	: Signed 10-bit immediate (–512 to 508, multiple of 4 only)
#u4	: Unsigned 4-bit immediate (0 to 15)
#u5	: Unsigned 5-bit immediate (0 to 31)
#u8	: Unsigned 8-bit immediate (0 to 255)
#u10	: Unsigned 10-bit immediate (0 to 1020, multiple of 4 only)
@dir8	: Unsigned 8-bit direct address (0 to 0XFF)
@dir9	: Unsigned 9-bit direct address (0 to 0X1FE, multiple of 2 only)
@dir10	: Unsigned 10-bit direct address (0 to 0X3FC, multiple of 4 only)
label9	: Signed 9-bit branch address (–0X100 to 0XFC, multiple of 2 only)
label12	: Signed 12-bit branch address (–0X800 to 0X7FC, multiple of 2 only)
label20	: Signed 20-bit branch address (–0X80000 to 0X7FFFF)
label32	: Signed 32-bit branch address (–0X80000000 to 0X7FFFFFFF)
@Ri	: Register indirect (R0 to R15, AC, FP, SP)
@Rj	: Register indirect (R0 to R15, AC, FP, SP)
@(R13, Rj)	: Register relative indirect (Rj: R0 to R15, AC, FP, SP)
@(R14, disp10)	: Register relative indirect (disp10: –0X200 to 0X1FC, multiple of 4 only)
@(R14, disp9)	: Register relative indirect (disp9: –0X100 to 0XFE, multiple of 2 only)
@(R14, disp8)	: Register relative indirect (disp8: –0X80 to 0X7F)
@(R15, udisp6)	: Register relative (udisp6: 0 to 60, multiple of 4 only)
@Ri+	: Register indirect with post-increment (R0 to R15, AC, FP, SP)
@R13+	: Register indirect with post-increment (R13, AC)
@SP+	: Stack pop
@–SP	: Stack push
(reglist)	: Register list

3. Instruction Types

4. Detailed Description of Instructions

• Add/subtract operation instructions (10 instructions)

Mnemonic	Type	OP	Cycle	N Z V C	Operation	Remarks
ADD Rj, Ri	A	A6	1	C C C C	$Ri + Rj \rightarrow Ri$	MSB is interpreted as a sign in assembly language
* ADD #s5, Ri	C'	A4	1	C C C C	$Ri + s5 \rightarrow Ri$	
ADD #i4, Ri	C	A4	1	C C C C	$Ri + \text{extu}(i4) \rightarrow Ri$	Zero-extension
ADD2 #i4, Ri	C	A5	1	C C C C	$Ri + \text{extu}(i4) \rightarrow Ri$	Sign-extension
ADDC Rj, Ri	A	A7	1	C C C C	$Ri + Rj + c \rightarrow Ri$	Add operation with sign
ADDN Rj, Ri	A	A2	1	- - - -	$Ri + Rj \rightarrow Ri$	MSB is interpreted as a sign in assembly language
* ADDN #s5, Ri	C'	A0	1	- - - -	$Ri + s5 \rightarrow Ri$	
ADDN #i4, Ri	C	A0	1	- - - -	$Ri + \text{extu}(i4) \rightarrow Ri$	Zero-extension
ADDN2 #i4, Ri	C	A1	1	- - - -	$Ri + \text{extu}(i4) \rightarrow Ri$	Sign-extension
SUB Rj, Ri	A	AC	1	C C C C	$Ri - Rj \rightarrow Ri$	
SUBC Rj, Ri	A	AD	1	C C C C	$Ri - Rj - c \rightarrow Ri$	Subtract operation with carry
SUBN Rj, Ri	A	AE	1	- - - -	$Ri - Rj \rightarrow Ri$	

• Compare operation instructions (3 instructions)

Mnemonic	Type	OP	Cycle	N Z V C	Operation	Remarks
CMP Rj, Ri	A	AA	1	C C C C	$Ri - Rj$	MSB is interpreted as a sign in assembly language
* CMP #s5, Ri	C'	A8	1	C C C C	$Ri - s5$	
CMP #i4, Ri	C	A8	1	C C C C	$Ri + \text{extu}(i4)$	Zero-extension
CMP2 #i4, Ri	C	A9	1	C C C C	$Ri + \text{extu}(i4)$	Sign-extension

• Logical operation instructions (12 instructions)

Mnemonic	Type	OP	Cycle	N Z V C	Operation	Remarks
AND Rj, Ri	A	82	1	C C - -	$Ri \& = Rj$	Word
AND Rj, @Ri	A	84	1 + 2a	C C - -	$(Ri) \& = Rj$	Word
ANDH Rj, @Ri	A	85	1 + 2a	C C - -	$(Ri) \& = Rj$	Half word
ANDB Rj, @Ri	A	86	1 + 2a	C C - -	$(Ri) \& = Rj$	Byte
OR Rj, Ri	A	92	1	C C - -	$Ri = Rj$	Word
OR Rj, @Ri	A	94	1 + 2a	C C - -	$(Ri) = Rj$	Word
ORH Rj, @Ri	A	95	1 + 2a	C C - -	$(Ri) = Rj$	Half word
ORB Rj, @Ri	A	96	1 + 2a	C C - -	$(Ri) = Rj$	Byte
EOR Rj, Ri	A	9A	1	C C - -	$Ri \wedge = Rj$	Word
EOR Rj, @Ri	A	9C	1 + 2a	C C - -	$(Ri) \wedge = Rj$	Word
EORH Rj, @Ri	A	9D	1 + 2a	C C - -	$(Ri) \wedge = Rj$	Half word
EORB Rj, @Ri	A	9E	1 + 2a	C C - -	$(Ri) \wedge = Rj$	Byte

• Bit manipulation arithmetic instructions (8 instructions)

Mnemonic	Type	OP	Cycle	N Z V C	Operation	Remarks
BANDL #u4, @Ri (u4: 0 to 0FH)	C	80	1 + 2a	--- --	(Ri) & = (F0H + u4)	Manipulate lower 4 bits
BANDH #u4, @Ri (u4: 0 to 0FH)	C	81	1 + 2a	--- --	(Ri) & = ((u4<<4) + 0FH)	Manipulate upper 4 bits
* BAND #u8, @Ri	*1		-	----	(Ri) & = u8	
BORL #u4, @Ri (u4: 0 to 0FH)	C	90	1 + 2a	--- --	(Ri) = u4	Manipulate lower 4 bits
BORH #u4, @Ri (u4: 0 to 0FH)	C	91	1 + 2a	--- --	(Ri) = (u4<<4)	Manipulate upper 4 bits
* BOR #u8, @Ri	*2		-	----	(Ri) = u8

* BEOR #u8, @Ri	*3		-	----	(Ri) ^ = u8	
BTSTL #u4, @Ri (u4: 0 to 0FH)	C	88	2 + a	0 C --	(Ri) & u4	Test lower 4 bits
BTSTH #u4, @Ri (u4: 0 to 0FH)	C	89	2 + a	C C --	(Ri) & (u4<<4)	Test upper 4 bits

*1: Assembler generates BANDL if result of logical operation “u8&0x0F” leaves an active (set) bit and generates BANDH if “u8&0xF0” leaves an active bit. Depending on the value in the “u8” format, both BANDL and BANDH may be generated.

*2: Assembler generates BORL if result of logical operation “u8&0x0F” leaves an active (set) bit and generates BORH if “u8&0xF0” leaves an active bit.

*3: Assembler generates BEORL if result of logical operation “u8&0x0F” leaves an active (set) bit and generates BEORH if “u8&0xF0” leaves an active bit.

• Add/subtract operation instructions (10 instructions)

Mnemonic	Type	OP	Cycle	N Z V C	Operation	Remarks

Notes: • The relations between rel8 field of TYPE-D and rel11 field of TYPE-F in the instruction format and assembler discription label9 and label12 are as follows.

$$\text{label9} \rightarrow \text{rel8} = (\text{label9} - \text{PC} - 2)/2$$

$$\text{label12} \rightarrow \text{rel11} = (\text{label12} - \text{PC} - 2)/2$$

- Delayed branch operation always executes next instruction (delay slot) before making a branch.
- Instructions allowed to be stored in the delay slot must meet one of the following conditions. If the other instruction is stored, this device may operate other operation than defined.
 - The instruction described "1" in the other cycle column than branch instruction.
 - The instruction described "a", "b", "c" or "d" in the cycle column.

• Direct addressing instructions

*1: CALL20:D

- (1) If label20 – PC – 2 is between –0x800 and +0x7fe, instruction is generated as follows;

CALL:D label12

- (2) If label20 – PC – 2 is outside of the range given in (1) or includes external reference symbol, instruction is generated as follows;

LDI:20 #label20, Ri

CALL:D @Ri

*2: BRA20:D

- (1) If label20 – PC – 2 is between –0x100 and +0xfe, instruction is generated as follows;

BRA:D label9

- (2) If label20 – PC – 2 is outside of the range given in (1) or includes external reference symbol, instruction is generated as follows;

LDI:20 #label20, Ri

JMP:D @Ri

*3: Bcc20:D (BEQ20:D to BHI20:D)

- (1) If label20 – PC – 2 is between –0x100 and +0xfe, instruction is generated as follows;

Bcc:D label9

- (2) If label20 – PC – 2 is outside of the range given in (1) or includes external reference symbol, instruction is generated as follows;

Bxcc false xcc is a revolt condition of cc

LDI:20 #label20, Ri

JMP:D @Ri

false:

• 32-bit normal macro branch instructions

Mnemonic	Operation	Remarks
* CALL32 label32, Ri	Next instruction address → RP, label32 → PC	Ri: Temporary register *1

All Rights Reserved.

The contents of this document are subject to change without notice. Customers are advised to consult with FUJITSU sales representatives before ordering.

The information and circuit diagrams in this document are presented as examples of semiconductor device applications, and are not intended to be incorporated in devices for actual use. Also, FUJITSU is unable to assume responsibility for infringement of any patent rights or other rights of third parties arising from the use of this information or circuit diagrams.

The contents of this document may not be reproduced or copied without the permission of FUJITSU LIMITED.

FUJITSU semiconductor devices are intended for use in standard applications (computers, office automation and other office equipments, industrial, communications, and measurement equipments, personal or household devices, etc.).

CAUTION:

Customers considering the use of our products in special applications where failure or abnormal operation may directly affect human lives or cause physical injury or property damage, or where extremely high levels of reliability are demanded (such as aerospace systems, atomic energy controls, sea floor repeaters, vehicle operating controls, medical devices for life support, etc.) are requested to consult with FUJITSU sales representatives before such use. The company will not be responsible for damages arising from such use without prior approval.

Any semiconductor devices have inherently a certain rate of failure. You must protect against injury, damage or loss from such failures by incorporating safety design measures into your facility and equipment such as redundancy, fire protection, and prevention of over-current levels and other abnormal operating conditions.

If any products described in this document represent goods or technologies subject to certain restrictions on export under the Foreign Exchange and Foreign Trade Control Law of Japan, the prior authorization by Japanese government should be required for export of those products from Japan.
