

HI-8382, HI-8383

January 2001

ARINC 429 DIFFERENTIAL LINE DRIVER

GENERAL DESCRIPTION

The HI-8382 and HI-8383 bus interface products are silicon gate CMOS devices designed as a line driver in accordance with the ARINC 429 bus specifications.

Inputs are provided for clocking and synchronization. These signals are AND'd with the DATA inputs to enhance system performance and allow the HI-8382 to be used in a variety of applications. Both logic and synchronization inputs feature built-in 2,000V minimum ESD input protection as well as TTL and CMOS compatibility.

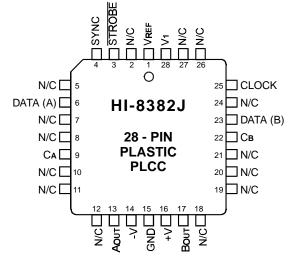

The differential outputs of the HI-8382 are independently programmable to either the high speed or low speed ARINC 429 output rise and fall time specifications through the use of two external capacitors. The output voltage swing is also adjustable by the application of an external voltage to the VREF input. The HI-8382 has on-chip Zener diodes in series with a fuse to each differential output protecting the ARINC bus from an overvoltage failure. The outputs each have a series resistance of 37.5 ohms. The HI-8383 is identical to the HI-8382 except that the series resistors are 13 ohms and the overvoltage protection circuitry has been eliminated.

The HI-8382 and HI-8383 are intended for use where logic signals must be converted to ARINC 429 levels such as a user ASIC or the HI-8282 ARINC 429 Serial Transmitter/Dual Receiver or the HI-6010 ARINC 429 Transmitter/Receiver. Holt products are readily available for both industrial and military applications. Please contact the Holt Sales Department for additional information, including data sheets for the HI-8282 and HI-6010 products.

FEATURES

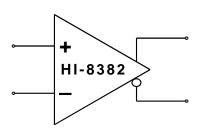

- Low power CMOS
- TTL and CMOS compatible inputs
- Programmable output voltage swing
- Adjustable ARINC rise and fall times
- Operates at data rates up to 100 Kbits
- Overvoltage protection
- Industrial and Military temperature ranges
- DSCC SMD part number

PIN CONFIGURATION (Top View)

⁽See Page 4-46 for additional package pin configurations)

FUNCTION

ARINC 429 DIFFERENTIAL LINE DRIVER

TRUTH TABLE

| SYNC | CLOCK | DATA(A) | DATA(B) | AOUT | BOUT | COMMENTS |
|------|-------|---------|---------|-------|-------|----------|
| Х | L | Х | Х | 0V | 0V | NULL |
| L | Х | Х | Х | 0V | 0V | NULL |
| н | н | L | L | 0V | 0V | NULL |
| н | н | L | н | -Vref | +Vref | LOW |
| н | н | Н | L | +Vref | -Vref | HIGH |
| н | н | Н | Н | 0V | 0V | NULL |

FUNCTIONAL DESCRIPTION

The SYNC and CLOCK inputs establish data synchronization utilizing two AND gates, one for each data input. Each logic input, including the power enable (STROBE) input, are TTL/CMOS compatible. Besides reducing chip current drain, STROBE also floats each output. However the overvoltage fuses and diodes of the HI-8382 are not switched out.

Figure 1 illustrates a typical ARINC 429 bus application. Three power supplies are necessary to operate the HI-8382; typically +15V, -15V and +5V. The chip also works with \pm 12V supplies. The +5V supply can also provide a reference voltage that determines the output voltage swing. The differential output voltage swing will equal 2VREF. If a value of VREF other than +5V is needed, a separate +5V power supply is required for pin V1.

With the DATA (A) input at a logic high and DATA (B) input at a logic low, Aout will switch to the +VREF rail and Bout will switch to the -VREF rail (ARINC HIGH state). With both data input signals at a logic low state, the outputs will both switch to OV (ARINC NULL state).

The driver output impedance, Rout, is nominally 75 ohms. The rise and fall times of the outputs can be calibrated through the selection of two external capacitor values that are connected to the CA and CB input pins. Typical values for high-speed operation (100KBPS) are CA = CB = 75pF and for low-speed operation (12.5 to 14KBPS) CA = CB = 500pF.

The driver can be externally powered down by applying a logic high to the STROBE input pin. If this feature is not being used, the pin should be tied to ground.

The CA and CB pins are inputs to unity gain amplifiers. Therefore they must be allowed to swing to -5V. Provision to switch capacitors must be done with analog switches that allow voltages below their ground.

Note 1. Heatsinking may be required for Output Short Circuit at +125°C and for 100KBPS at +125°C.

Note 2.

The fuses used for Output Overvoltage Protection may be blown by the presence of a voltage at either output that is greater than ±12.0V with respect to GND. (HI-8382 only) Derate above +25°C, 11.5mW/°C for 16-PIN DIP and 32-PIN CERQUAD, 7.5 mW/°C for 28-PIN LCC, 14.2 mW/°C for 28-PIN PLCC Note 3.

NOTE: Stresses above those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only. Functional operation of the device at these or any other conditions above those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Notes:

1. All data taken in still air on devices soldered to a single layer copper PCB (3" X 4.5" X .062").

- 2. At 100% duty cycle, 15V power supplies. For 12V power supplies multiply all tabulated values by 0.8.
- 3. Low Speed: Data Rate = 12.5 Kbps, Load: R = 400 Ohms, C = 30 nF.
- 4. High Speed: Data Rate = 100 Kbps, Load: R = 400 Ohms, C = 10 nF. Data not presented for C = 30 as this is considered unrealistic for high speed operation.
- 5. Similar results would be obtained with AOUT shorted to BOUT.
- 6. For applications requiring survival with continuous short circuit, operation above $Tj = 175^{\circ}C$ is not recommended.
- 7. Data will vary depending on air flow and the method of heat sinking employed.

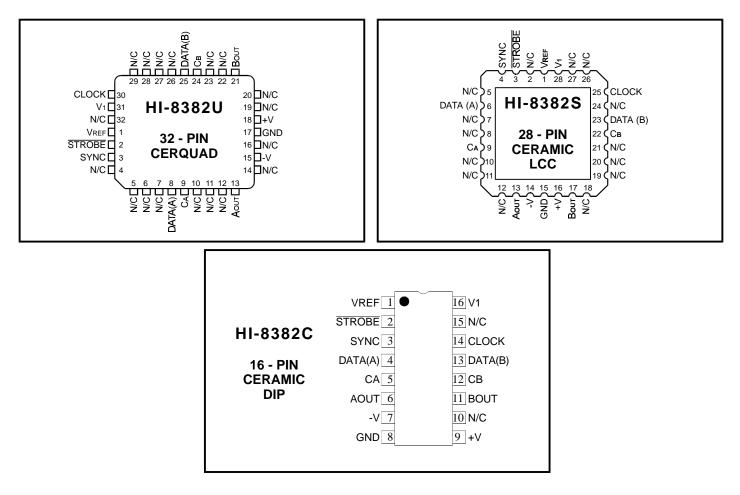

ORDERING INFORMATION

HI-8383 part numbers identical except the SMD version is not available.
