**ICS8731-01**

LOW SKEW, 1-TO-11 DIFFERENTIAL-TO-3.3V LVPECL  
CLOCK MULTIPLIER / ZERO DELAY BUFFER

## GENERAL DESCRIPTION

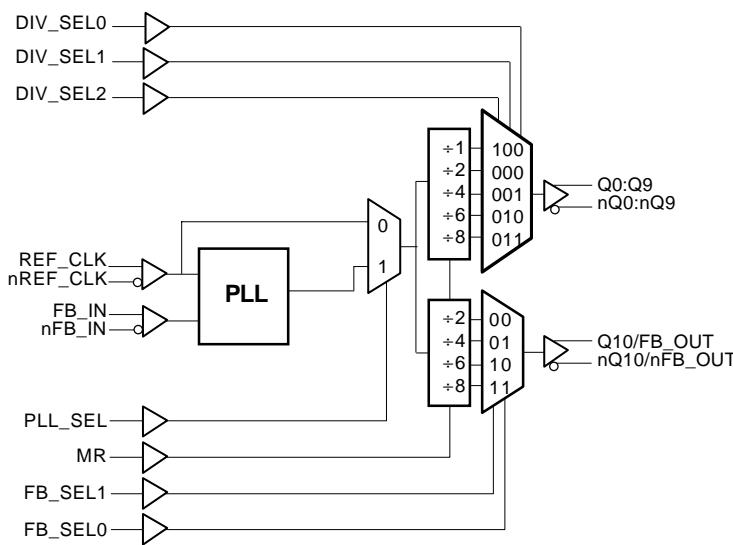

The ICS8731-01 is a low voltage, low skew, 1-to-11 Differential-to-3.3V LVPECL Clock Multiplier/Zero Delay Buffer and a member of the HiPerClockS™ family of High Performance Clock Solutions from ICS. With output frequencies up to 650MHz the ICS8731-01 is targeted at high performance clock applications. Along with a fully integrated PLL the ICS8731-01 contains frequency configurable, differential outputs and external feedback inputs for multiplying clock frequencies and regenerating clocks with "zero delay". Frequency multiplication is achieved by utilizing the separate feedback and clock output dividers. The value of the multiplier is determined by the ratio of the feedback divider, M, to the output divider, N. For multiplier values greater than 1, M must be greater than N. For multiplier values less than 1, M must be less than N. The zero delay mode is achieved with M and N at equal values. The divide values of the clock and feedback outputs are controlled by the DIV\_SEL0:2 and FB\_SEL0:1 inputs, respectively. The ICS8731-01 accepts any differential signal and translates it to differential 3.3V LVPECL output levels.

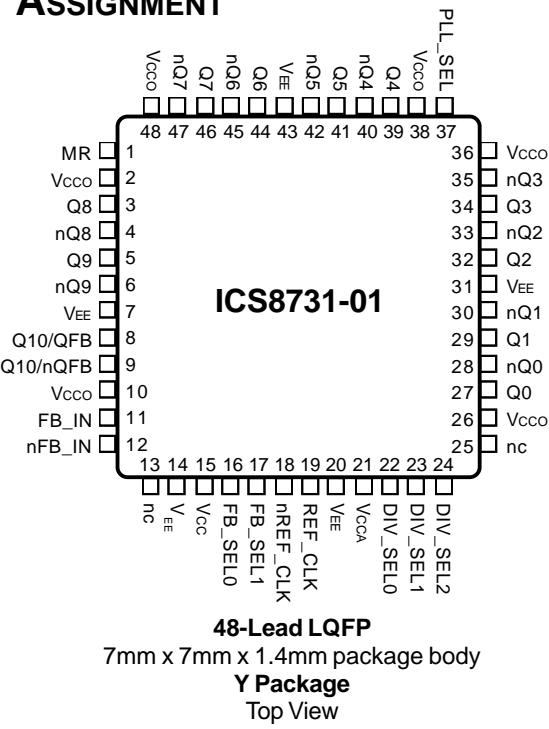

## FEATURES

- 11 differential 3.3V LVPECL outputs
- Differential reference clock input pair
- REF\_CLK, nREF\_CLK pair can accept the following differential input levels: LVDS, LVPECL, L VHSTL, SSTL, HCSL
- Output frequency up to 650MHz
- Maximum reference clock input frequency: 250MHz
- Accepts any single-ended input signal with a resistor bias on nCLK input
- External feedback for zero delay capability
- Output skew: 200ps (maximum)
- Cycle-to-cycle jitter: 50ps (typical)
- Full 3.3V operating supply
- 0°C to 70°C ambient operating temperature

## BLOCK DIAGRAM

## PIN ASSIGNMENT

The Preliminary Information presented herein represents a product in prototyping or pre-production. The noted characteristics are based on initial product characterization. Integrated Circuit Systems, Incorporated (ICS) reserves the right to change any circuitry or specifications without notice.

## Absolute Maximum Ratings

### Absolute Maximum Ratings

Supply Voltage, $V_{CCx}$	4.6V
Inputs, $V_I$	-0.5V to $V_{CC} + 0.5V$
Outputs, $V_O$	-0.5V to $V_{CCO} + 0.5V$
Package Thermal Impedance, $\theta_{JA}$	47.9°C/W (0 Ifpm)
Storage Temperature, $T_{STG}$	-65°C to 150°C

Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. These ratings are stress specifications only. Functional operation of product at these conditions or any conditions beyond those listed in the DC Characteristics or AC Characteristics is not implied. Exposure to absolute maximum rating conditions for extended periods may affect product reliability.

**TABLE 6A. POWER SUPPLY DC CHARACTERISTICS,  $V_{CC} = V_{CCA} = V_{CCO} = 3.3V \pm 5\%$ ,  $T_A = 0^\circ C$  TO  $70^\circ C$**

Symbol	Parameter	Test Conditions	Minimum	Typical	Maximum	Units
$V_{CC}$	Positive Supply Voltage		3.135	3.3	3.465	V
$V_{CCA}$	Analog Supply Voltage		3.135	3.3	3.465	V

$t_{jit(cc)}$	Cycle-to-Cycle Jitter; NOTE 5			50		ps
$t_L$	PLL Lock Time				1	ms
$t_R$	Output Rise Time	20% to 80%	200		700	ps
$t_F$	Output Fall Time	20% to 80%	200		700	ps
odc	Output Duty Cycle		48	50	52	%

All parameters measured at fMAX unless noted otherwise.

NOTE 1: Measured from the differential input crossing point to the differential output crossing point.

NOTE 2: Defined as the time difference between the input reference clock and the averaged feedback input signal when the PLL is locked and the input reference frequency is stable.

NOTE 3: Defined as skew between outputs at the same supply voltages and with equal load conditions.

Measured at the output differential cross points.

NOTE 4: Defined as skew across banks of outputs operating at different frequency with the same supply voltages and equal load conditions.

NOTE 5: This parameter is defined in accordance with JEDEC Standard 65.

## APPLICATION INFORMATION

### TERMINATION FOR LVPECL OUTPUTS

The clock layout topology shown below is a typical termination for LVPECL outputs. The two different layouts mentioned are recommended only as guidelines.

F<sub>OUT</sub> and nF<sub>OUT</sub> are low impedance follower outputs that generate ECL/LVPECL compatible outputs. Therefore, terminating resistors (DC current path to ground) or current sources must be used for functionality. These outputs are designed to drive

50Ω transmission lines. Matched impedance techniques should be used to maximize operating frequency and minimize signal distortion. Figures 1A and 1B show two different layouts which are recommended only as guidelines. Other suitable clock layouts may exist and it would be recommended that the board designers simulate to guarantee compatibility across all printed circuit and clock component process variations.

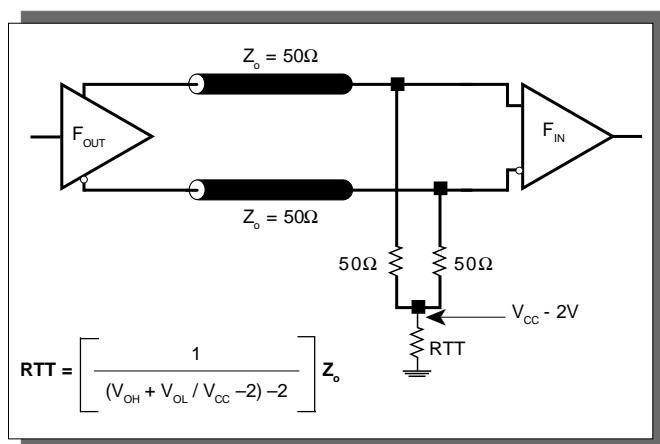

FIGURE 1A - LVPECL OUTPUT TERMINATION

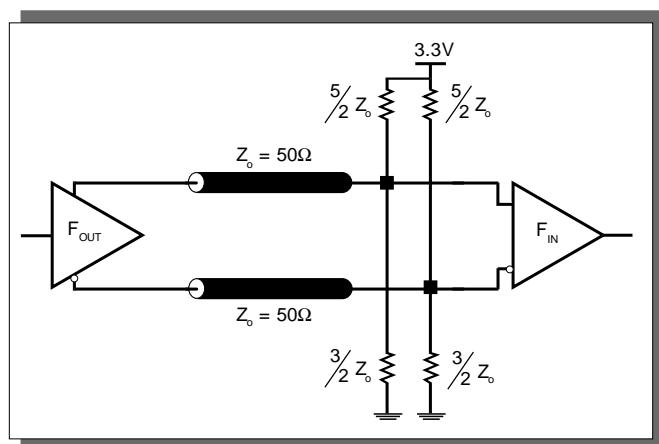

FIGURE 1B - LVPECL OUTPUT TERMINATION

### POWER SUPPLY FILTERING TECHNIQUES

As in any high speed analog circuitry, the power supply pins are vulnerable to random noise. The ICS8731-01 provides separate power supplies to isolate any high switching noise from the outputs to the internal PLL. V<sub>CC</sub>, V<sub>CCA</sub>, and V<sub>CCO</sub> should be individually connected to the power supply plane through vias, and bypass capacitors should be used for each pin. To achieve optimum jitter performance, power supply isolation is required. Figure 2 illustrates how a 10Ω resistor along with a 10μF and a .01μF bypass capacitor should be connected to each V<sub>CCA</sub> pin.

## POWER CONSIDERATIONS

This section provides information on power dissipation and junction temperature for the ICS8731-01. Equations and example calculations are also provided.

### 1. Power Dissipation.

The total power dissipation for the ICS8731-01 is the sum of the core power plus the power dissipated in the load(s).

The following is the power dissipation for  $V_{CC} = 3.3V + 5\% = 3.465V$ , which gives worst case results.

**NOTE:** Please refer to Section 3 for details on calculating power dissipated in the load.

- Power (core)<sub>MAX</sub> =  $V_{CC\_MAX} * I_{EE\_MAX} = 3.465V * 130mA = 450.5mW$
- Power (outputs)<sub>MAX</sub> = **30.2mW/Loaded Output pair**  
If all outputs are loaded, the total power is  $11 * 30.2mW = 332.2mW$

**Total Power<sub>MAX</sub>** (3.465V, with all outputs switching) =  $450.5mW + 332.2mW = 782.7mW$

### 2. Junction Temperature.

Junction temperature,  $T_j$ , is the temperature at the junction of the bond wire and bond pad and directly affects the reliability of the device. The maximum recommended junction temperature for HiPerClockS™ devices is 125°C.

The equation for  $T_j$  is as follows:  $T_j = \theta_{JA} * Pd\_total + T_A$

$T_j$  = Junction Temperature

$\theta_{JA}$  = Junction-to-Ambient Thermal Resistance

$Pd\_total$  = Total Device Power Dissipation (example calculation is in section 1 above)

$T_A$  = Ambient Temperature

In order to calculate junction temperature, the appropriate junction-to-ambient thermal resistance  $\theta_{JA}$  must be used. Assuming a moderate air flow of 200 linear feet per minute and a multi-layer board, the appropriate value is 42.1°C/W per Table 8 below.

Therefore,  $T_j$  for an ambient temperature of 70°C with all outputs switching is:

$70^\circ C + 0.783W * 42.1^\circ C/W = 103^\circ C$ . This is well below the limit of 125°C

This calculation is only an example.  $T_j$  will obviously vary depending on the number of loaded outputs, supply voltage, air flow, and the type of board (single layer or multi-layer).

**TABLE 8. THERMAL RESISTANCE  $\theta_{JA}$  FOR 48-PIN LQFP, FORCED CONVECTION**

### $\theta_{JA}$ by Velocity (Linear Feet per Minute)

	<b>0</b>	<b>200</b>	<b>500</b>
Single-Layer PCB, JEDEC Standard Test Boards	67.8°C/W	55.9°C/W	50.1°C/W
Multi-Layer PCB, JEDEC Standard Test Boards	47.9°C/W	42.1°C/W	39.4°C/W

**NOTE:** Most modern PCB designs use multi-layered boards. The data in the second row pertains to most designs.

CLOCK MULTIPLIER / ZERO DELAY BUFFER

### 3. Calculations and Equations.

The purpose of this section is to derive the power dissipated into the load.

LVPECL output driver circuit and termination are shown in *Figure 3*.

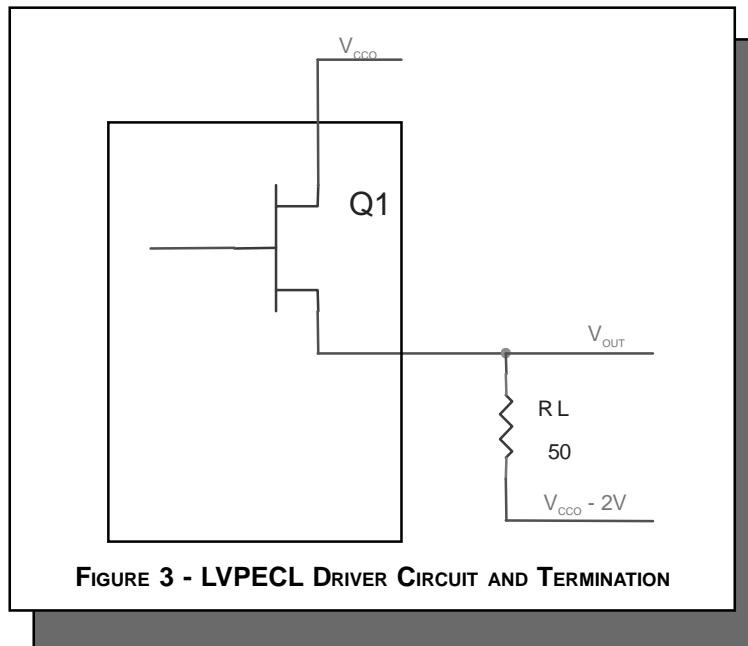

FIGURE 3 - LVPECL DRIVER CIRCUIT AND TERMINATION

To calculate worst case power dissipation into the load, use the following equations which assume a  $50\Omega$  load, and a termination voltage of  $V_{cc} - 2V$ .

- For logic high,  $V_{out} = V_{oh\_max} = V_{cc\_max} - 1.0V$

$$(V_{cc\_max} - V_{oh\_max}) = 1.0V$$

- For logic low,  $V_{out} = V_{ol\_max} = V_{cc\_max} - 1.7V$

$$(V_{cc\_max} - V_{ol\_max}) = 1.7V$$

$Pd_H$  is power dissipation when the output drives high.

$Pd_L$  is the power dissipation when the output drives low.

$$Pd_H = [(V_{oh\_max} - (V_{cc\_max} - 2V))/R_L] * (V_{cc\_max} - V_{oh\_max}) = [(2V - (V_{cc} - V_{oh\_max}))/R_L] * (V_{cc} - V_{oh\_max}) = [(2V - 1V)/50\Omega] * 1V = 20.0mW$$

$$Pd_L = [(V_{ol\_max} - (V_{cc\_max} - 2V))/R_L] * (V_{cc\_max} - V_{ol\_max}) = [(2V - (V_{cc} - V_{ol\_max}))/R_L] * (V_{cc} - V_{ol\_max}) = [(2V - 1.7V)/50\Omega] * 1.7V = 10.2mW$$

Total Power Dissipation per output pair =  $Pd_H + Pd_L = 30.2mW$
