ICS9248-114

AMD - K7™ System Clock Chip

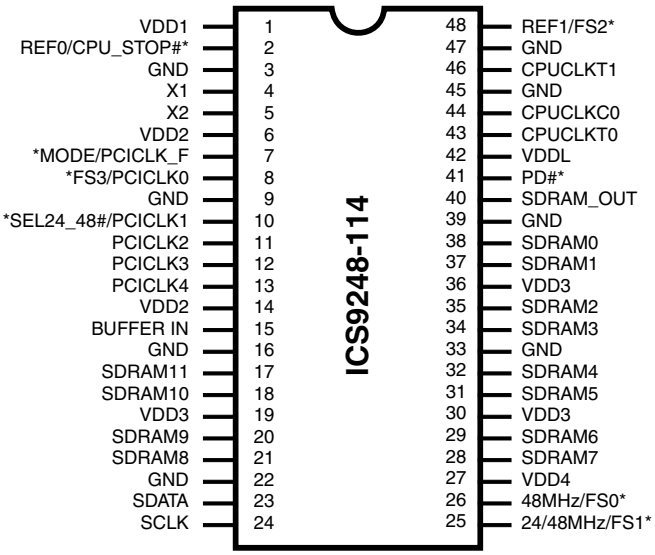
Recommended Application:
VIA K7 style chipset

Output Features:
- 1 - Differential pair open drain CPU clocks
- 1 - Single-ended open drain CPU clock
- 13 - SDRAM @ 3.3V
- 6 - PCI @3.3V,
- 1 - 48MHz, @3.3V fixed.
- 1 - 24/48MHz @ 3.3V
- 2 - REF @3.3V, 14.318MHz.

Features:
- Up to 155MHz frequency support
- Support power management: CPU stop and Power down Mode from I^2C programming.
- Spread spectrum for EMI control (0 to -0.5% down spread, ± 0.25% center spread).
- Uses external 14.318MHz crystal

Skew Specifications:
- CPUT – CPUC: <200ps
- PCI – PCI: <500ps
- CPU – PCI: <500ps

Pin Configuration



48-Pin 300mil SSOP

* Internal Pull-up Resistor of 120K to VDD

Pin Descriptions

PIN NUMBER	PIN NAME	TYPE	DESCRIPTION
1	VDD1	PWR	REF, XTAL power supply, nominal 3.3V
2	REF0	OUT	14.318 Mhz reference clock.This REF output is the STRONGER buffer for ISA BUS loads
	CPU_STOP#[1, 2]	IN	This asynchronous input halts CPUCLKT, CPUCLKC & SDRAM at logic "0" level when driven low.
3,9,16,22, 33,39,45, 47	GND	PWR	Ground
4	X1	IN	Crystal input, has internal load cap (36pF) and feedback resistor from X2
5	X2	OUT	Crystal output, nominally 14.318MHz. Has internal load cap (36pF)
6,14	VDD2	PWR	Supply for PCICLK_F and PCICLK, nominal 3.3V
7	PCICLK_F	OUT	Free running PCI clock not affected by PCI_STOP# for power management.
	MODE[1, 2]	IN	Pin 2 function select pin, 1=Desktop Mode, 0=Mobile Mode. Latched Input.
8	FS3[1, 2]	IN	Frequency select pin. Latched Input. Internal Pull-down to GND
	PCICLK0	OUT	PCI clock output
10	SEL24_48#[1, 2]	IN	Logic input to select 24 or 48MHz for pin 25 output
	PCICLK1	OUT	PCI clock output.
13, 12, 11	PCICLK (4:2)	OUT	PCI clock outputs.
15	BUFFER IN	IN	Input to Fanout Buffers for SDRAM outputs.
17, 18, 20, 21, 28, 29, 31, 32, 34, 35,37,38	SDRAM (11:0)	OUT	SDRAM clock outputs, Fanout Buffer outputs from BUFFER IN pin (controlled by chipset).
19,30,36	VDD3	PWR	Supply for SDRAM nominal 3.3V.
23	SDATA	IN	Data input for I^2C serial input, 5V tolerant input
24	SCLK	IN	Clock input of I^2C input, 5V tolerant input
25	24_48MHz	OUT	24MHz/48MHz clock output
	FS1[1, 2]	IN	Frequency select pin. Latched Input.
26	48MHz	OUT	48MHz output clock
	FS0[1, 2]	IN	Frequency select pin. Latched Input
27	VDD4	PWR	Power for 24 & 48MHz output buffers and fixed PLL core.
40	SDRAM_OUT	OUT	Reference clock for SDRAM zero delay buffer
41	PD#[1, 2]	IN	Powers down chip, active low
42	VDD	PWR	Supply for core 3.3V
46, 43	CPUCLKT (1:0)	OUT	"True" clocks of differential pair CPU outputs. These open drain outputs need an external 1.5V pull-up.
44	CPUCLKC0	OUT	"Complementory" clocks of differential pair CPU outputs. These open drain outputs need an external 1.5V pull-up.
48	REF1	OUT	14.318 MHz reference clock.
	FS2[1, 2]	IN	Frequency select pin. Latched Input

Notes:

1: Internal Pull-up Resistor of 120K to 3.3V on indicated inputs

2: Bidirectional input/output pins, input logic levels are latched at internal power-on-reset. Use 10Kohm resistor to program logic Hi to VDD or GND for logic low.

General Description

The **ICS9248-114** is a main clock synthesizer chip for AMD-K7 based systems with VIA style chipset. This provides all clocks required for such a system.

Spread spectrum may be enabled through I^2C programming. Spread spectrum typically reduces system EMI by 8dB to 10dB. This simplifies EMI qualification without resorting to board design iterations or costly shielding. The ICS9248-114 employs a proprietary closed loop design, which tightly controls the percentage of spreading over process and temperature variations.

Serial programming I^2C interface allows changing functions, stop clock programming and frequency selection.

Absolute Maximum Ratings

Supply Voltage ..... 5.5 V

Logic Inputs ..... GND –0.5 V to V_{DD} +0.5 V

Ambient Operating Temperature ..... 0°C to +70°C

Storage Temperature ..... –65°C to +150°C

Stresses above those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These ratings are stress specifications only and functional operation of the device at these or any other conditions above those listed in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect product reliability.

Notes:

1. The ICS clock generator is a slave/receiver, I²C component. It can read back the data stored in the latches for verification. **Read-Back will support Intel PIIX4 "Block-Read" protocol**.
2. The data transfer rate supported by this clock generator is 100K bits/sec or less (standard mode)
3. The input is operating at 3.3V logic levels.
4. The data byte format is 8 bit bytes.
5. To simplify the clock generator I²C interface, the protocol is set to use only "**Block-Writes**" from the controller. The bytes must be accessed in sequential order from lowest to highest byte with the ability to stop after any complete byte has been transferred. The Command code and Byte count shown above must be sent, but the data is ignored for those two bytes. The data is loaded until a Stop sequence is issued.
6. At power-on, all registers are set to a default condition, as shown.

Shared Pin Operation - Input/Output Pins

The I/O pins designated by (input/output) on the ICS9248-114 serve as dual signal functions to the device. During initial power-up, they act as input pins. The logic level (voltage) that is present on these pins at this time is read and stored into a 5-bit internal data latch. At the end of Power-On reset, (see AC characteristics for timing values), the device changes the mode of operations for these pins to an output function. In this mode the pins produce the specified buffered clocks to external loads.

To program (load) the internal configuration register for these pins, a resistor is connected to either the VDD (logic 1) power supply or the GND (logic 0) voltage potential. A 10 Kilohm (10K) resistor is used to provide both the solid CMOS programming voltage needed during the power-up programming period and to provide an insignificant load on the output clock during the subsequent operating period.

Figure 1 shows a means of implementing this function when a switch or 2 pin header is used. With no jumper is installed the pin will be pulled high. With the jumper in place the pin will be pulled low. If programmability is not necessary, than only a single resistor is necessary. The programming resistors should be located close to the series termination resistor to minimize the current loop area. It is more important to locate the series termination resistor close to the driver than the programming resistor.

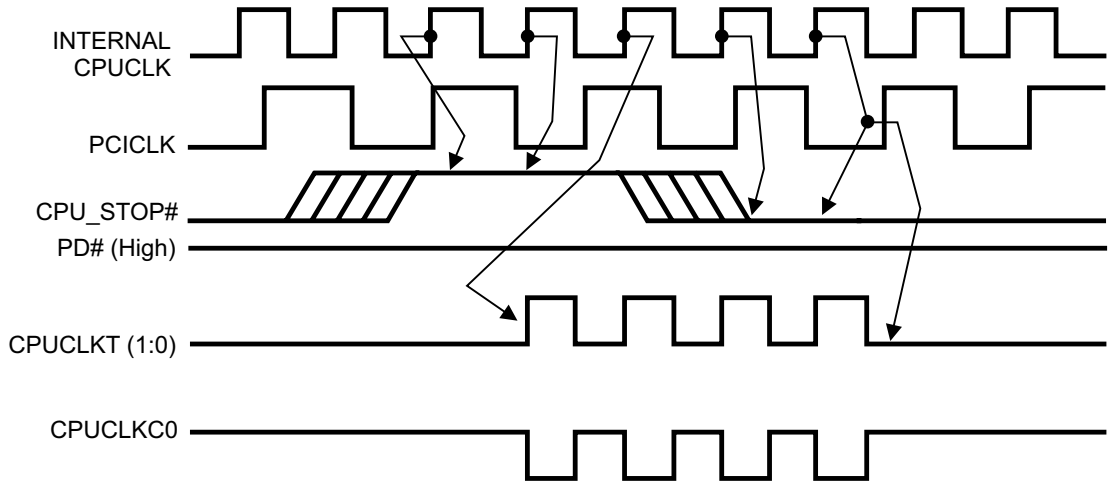
CPU_STOP# Timing Diagram

CPU_STOP# is an asychronous input to the clock synthesizer. It is used to turn off the CPU clocks for low power operation. CPU_STOP# is synchronized by the **ICS9248-114**. The minimum that the CPU clock is enabled (CPU_STOP# high pulse) is 100 CPU clocks. All other clocks will continue to run while the CPU clocks are disabled. The CPU clocks will always be stopped in a low state and start in such a manner that guarantees the high pulse width is a full pulse. CPU clock on latency is less than 4 CPU clocks and CPU clock off latency is less than 4 CPU clocks.

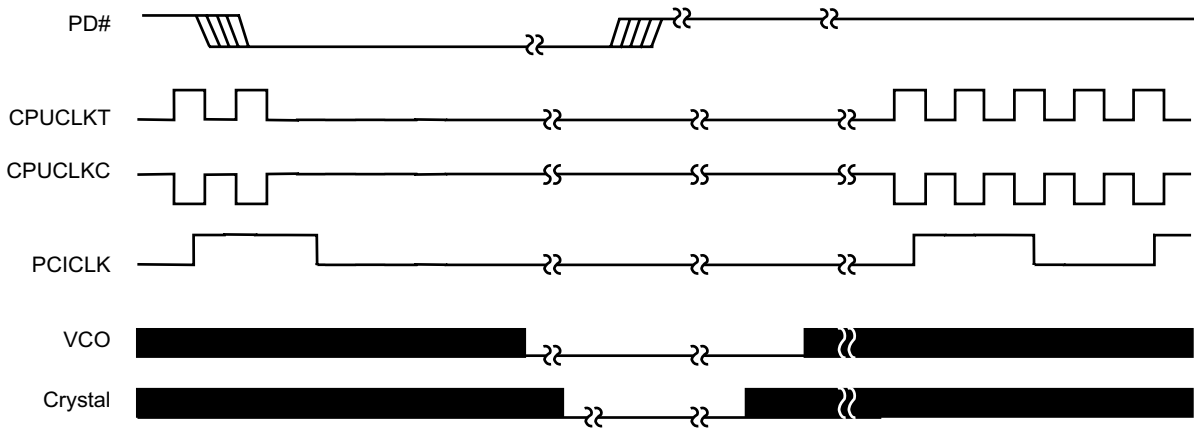


Notes:
1. All timing is referenced to the internal CPU clock.
2. CPU_STOP# is an asynchronous input and metastable conditions may exist. This signal is synchronized to the CPU clocks inside the ICS9248-114.
3. All other clocks continue to run undisturbed.

PD# Timing Diagram

The power down selection is used to put the part into a very low power state without turning off the power to the part. PD# is an asynchronous active low input. This signal needs to be synchronized internal to the device prior to powering down the clock synthesizer.

Internal clocks are not running after the device is put in power down. When PD# is active low all clocks need to be driven to a low value and held prior to turning off the VCOs and crystal. The power up latency needs to be less than 3 mS. The power down latency should be as short as possible but conforming to the sequence requirements shown below. PCI_STOP# and CPU_STOP# are considered to be don't cares during the power down operations. The REF and 48MHz clocks are expected to be stopped in the LOW state as soon as possible. Due to the state of the internal logic, stopping and holding the REF clock outputs in the LOW state may require more than one clock cycle to complete.



Notes:
1. All timing is referenced to the Internal CPUCLK (defined as inside the ICS9248-114 device).
2. As shown, the outputs Stop Low on the next falling edge after PD# goes low.
3. PD# is an asynchronous input and metastable conditions may exist. This signal is synchronized inside this part.
4. The shaded sections on the VCO and the Crystal signals indicate an active clock.
5. Diagrams shown with respect to 133MHz. Similar operation when CPU is 100MHz.
