

### Frequency Generator & Integrated Buffers

#### **Recommended Application:**

SIS 530/620 style chipset

#### **Output Features:**

- - 3 CPU @ 2.5V/3.3V up to 133.3 MHz.
- - 6 PCI @ 3.3V (including 1 free-running)
- - 13 SDRAMs @ 3.3V up to 133.3MHz.
- - 3 REF @ 3.3V, 14.318MHz
- - 1 clock @ 24/14.3 MHz selectable output for SIO
- - 1 Fixed clock at 48MHz (3.3V)
- - 1 IOAPIC @ 2.5V / 3.3V

#### Features:

- Up to 133MHz frequency support
- Support power management: CPU, PCI, SDRAM stop and Power down Mode from I<sup>2</sup>C programming.
- Spread spectrum for EMI control (  $\pm$  0.25% center spread & 0 to -0.5% down spread).
- Uses external 14.318MHz crystal
- · FS pins for frequency select

#### **Key Specifications:**

- CPU CPU<175ps
- SDRAM SDRAM < 350ps
- CPU–SDRAM < 500ps
- CPU(early) PCI: 1-4ns (typ. 2ns)
- PCI PCI <500ps

#### **Pin Configuration**

#### 48-Pin SSOP

\* Internal Pull-up Resistor of 120K to 3.3V on indicated inputs

#### **Block Diagram**

#### **Functionality**

| SD_SEL | FS2 | FS1   FS0 |     | CPU    | SDRAM  | PCI   |
|--------|-----|-----------|-----|--------|--------|-------|

| 1      | 1   | 1         | 1   | 133.30 | 133.30 | 33.33 |

Note: REF, IOAPIC = 14.318MHz

## ICS9248-128

## **Pin Descriptions**

| Pin number                     | Pin name                 | Type   | Description   |
|--------------------------------|--------------------------|--------|---|
| 1                              | VDDR/X                   | Power  | Isolated 3.3 V power for crystal & reference  |
| 21,2                           | REF0                     | Output | 3.3V, 14.318 MHz reference clock output.  |
| _                              | Mode                     | Input  | Function select pin, 1=desk top mode, 0=mobile mode. Latched input.   |
| 3,9,16,22,<br>27,33,39         | GND                      | Power  | 3.3 V Ground  |
| 4                              | X1                       | Input  | 14.318 MHz crystal input  |
| 5                              | X2                       | Output | 14.318 MHz crystal output   |
| 6,14                           | VDDPCI                   | Power  | 3.3 V power for the PCI clock outputs   |
| 7 <sup>1,2</sup>               | FS1                      | Input  | Logic input frequency select bit. Input latched at power-on.  |
| ,                              | PCICLK_F                 | Output | 3.3 V free running PCI clock output, will not be stopped by the PCI_STOP#   |
| 8 <sup>1,2</sup>               | PCICLK 0                 | Output | 3.3 V PCI clock outputs, generating timing requirements for Pentium II  |
|                                | FS2                      | Input  | Logic input frequency select bit. Input latched at power-on.  |
| 13, 12, 11, 10                 | PCICLK (4:1)             | Output | 3.3 V PCI clock outputs, generating timing requirements for Pentium II  |
| 15,28,29,31,32,<br>34,35,37,38 | SDRAM 12,<br>SDRAM (7:0) | Output | SDRAM clock outputs. Frequency is selected by SD-Sel latched input.   |
|                                | SDRAM 11                 | Output | SDRAM clock outputs. Frequency is selected by SD-Sel latched input.   |
| 17 <sup>1</sup>                | CPU_STOP#                | Input  | Asynchronous active low input pin used to stop the CPUCLK in low state, all other clocks will continue to run. The CPUCLK will have a "Turnon" latency of at least 3 CPU clocks.  |
|                                | SDRAM 10                 | Output | SDRAM clock outputs. Frequency is selected by SD-SEL latched input.   |
| 18 <sup>1</sup>                | PCI-STOP#                | Input  | Synchronous active low input used to stop the PCICLK in a low state. It will not effect PCICLK_F or any other outputs.  |
| 19                             | VDDSD/C                  | Power  | 3.3 V power for SDRAM outputs and core  |
|                                | SDRAM 9                  | Output | SDRAM clock outputs. Frequency is selected by SD-Sel latched input.   |
| 20 1                           | SDRAM_STOP#              | Input  | Asynchronous active low input used to stop the SDRAM in a low state.  It will not effect any other outputs.   |
|                                | SDRAM 8                  | Output | SDRAM clock outputs. Frequency is selected by SD-Sel latched input.   |
| 21 <sup>1</sup>                | PD#                      | Input  | Asynchronous active low input pin used to power down the device into a low power state. The internal clocks are disabled and the VCO and the crystal are stopped. The latency of the power down will not be greater than 3ms. |
| 23                             | SDATA                    | Input  | Data input for I <sup>2</sup> C serial input.   |
| 24                             | SCLK                     | Input  | Clock input of I <sup>2</sup> C input   |
| 25 <sup>1,2</sup>              | SEL24_14#                | Input  | This input pin controls the frequency of the SIO. If logic 0 at power on SIO=14.318 MHz . If logic 1 at power-on SIO=24MHz.   |
| 25                             | SIO                      | Output | Super I/O output. 24 or 14.318 MHz. Selectable at power-up by SEL24_14MHz   |
|                                | FS0                      | Input  | Logic input frequency select bit. Input latched at power-on.  |
| 26 <sup>1,2</sup>              | 48 MHz                   | Output | 3.3 V 48 MHz clock output, fixed frequency clock typically used with USB devices  |
| 30,36                          | VDDSDR                   | Power  | 3.3 V power for SDRAM outputs   |
| 40,41,43                       | CPUCLK (3:1)             | 0utput | 2.5 V CPU and Host clock outputs  |
| 42                             | VDDLCPU                  | Power  | 2.5 V power for CPU   |
| 4.0                            | REF2                     | Output | 3.3V, 14.318 MHz reference clock output.  |
| 44 <sup>1,2</sup>              | CPU3.3#_2.5              | Input  | This pin selects the operating voltage for the CPU. If logic 0 at power on CPU=3.3 V and if logic 1 at power on CPU=2.5 V operating voltage.  |
| 45                             | GNDL                     | Power  | 2.5 V Ground for the IOAPIC or CPU  |
| 46 <sup>1,2</sup>              | REF1                     | Output | 3.3V, 14.318 MHz reference clock output.  |
|                                | SD_SEL#                  | Input  | This input pin controls the frequency of the SDRAM.   |
| 47                             | IOAPIC                   | Output | 2.5V fixed 14.318 MHz IOAPIC clock outputs  |
| 48                             | VDDLAPIC                 | Power  | 2.5 V power for IOAPIC  |

- 1: Internal Pull-up Resistor of 120K to 3.3V on indicated inputs
- Bidirectional input/output pins, input logic levels are latched at internal power-on-reset. Use 10Kohm resistor to program logic Hi to VDD or GND for logic low.

### **General Description**

The ICS9248-128 is the single chip clock solution for Desktop/Notebook designs using the SIS style chipset. It provides all necessary clock signals for such a system.

Spread spectrum may be enabled through  $I^2C$  programming. Spread spectrum typically reduces system EMI by 8dB to 10dB. This simplifies EMI qualification without resorting to board design iterations or costly shielding. The **ICS9248-128** employs a proprietary closed loop design, which tightly controls the percentage of spreading over process and temperature variations.

Serial programming  $I^2C$  interface allows changing functions, stop clock programming and frequency selection. The SD\_SEL latched input allows the SDRAM frequency to follow the CPUCLK frequency(SD\_SEL=1) or other clock frequencies (SD\_SEL=0)

### Mode Pin - Power Management Input Control

| MODE, Pin 2<br>(Latched Input) | Pin 17    | Pin 18    | Pin 20      | Pin 21   |
|--------------------------------|-----------|-----------|-------------|----------|
| 0                              | CPU_STOP# | PCI_STOP# | SDRAM_STOP# | PD#      |
|                                | (INPUT)   | (INPUT)   | (INPUT)     | (INPUT)  |
| 1                              | SDRAM 11  | SDRAM 10  | SDRAM9      | SDRAM8   |
|                                | (OUTPUT)  | (OUTPUT)  | (OUTPUT)    | (OUTPUT) |

| Bit 5 | 26    | 1   | 48MHz       |
| Bit 4 | 15    | 1   | SDRAM12     |
| Bit 3 | 17    | 1   | SDRAM11     |
| Bit 2 | 18    | 1   | SDRAM10     |
| Bit 1 | 20    | 1   | SDRAM9      |
| Bit 0 | 21    | 1   | SDRAM8      |

#### **Notes:**

1. Inactive means outputs are held LOW and are disabled from switching.

### ICS9248-128

### **Absolute Maximum Ratings**

Supply Voltage ...... 5.5 V

Logic Inputs . . . . . . . . . . . . . GND –0.5 V to  $V_{DD}$  +0.5 V

Ambient Operating Temperature . . . . . .  $0^{\circ}$ C to  $+70^{\circ}$ C Storage Temperature . . . . .  $-65^{\circ}$ C to  $+150^{\circ}$ C

Stresses above those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These ratings are stress specifications only and functional operation of the device at these or any other conditions above those listed in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect product reliability.

#### **Electrical Characteristics - Input/Supply/Common Output Parameters**

 $T_A = 0$  - 70C; Supply Voltage  $V_{DD} = V_{DDL} = 3.3 \text{ V} + /-5\%$  (unless otherwise stated)

### General I<sup>2</sup>C serial interface information

The information in this section assumes familiarity with I<sup>2</sup>C programming. For more information, contact ICS for an I<sup>2</sup>C programming application note.

#### **How to Write:**

- Controller (host) sends a start bit.
- Controller (host) sends the write address D2 (H)
- ICS clock will acknowledge
- · Controller (host) sends a dummy command code
- ICS clock will acknowledge
- Controller (host) sends a dummy byte count
- ICS clock will acknowledge
- Controller (host) starts sending first byte (Byte 0) through byte 5
- ICS clock will acknowledge each byte one at a time.
- Controller (host) sends a Stop bit

| How to Write:      |                      |  |  |  |
|--------------------|----------------------|--|--|--|
| Controller (Host)  | ICS (Slave/Receiver) |  |  |  |
| Start Bit          |                      |  |  |  |
| Address            |                      |  |  |  |
| D2 <sub>(H)</sub>  |                      |  |  |  |
|                    | ACK                  |  |  |  |
| Dummy Command Code |                      |  |  |  |
|                    | ACK                  |  |  |  |
| Dummy Byte Count   |                      |  |  |  |
|                    | ACK                  |  |  |  |
| Byte 0             |                      |  |  |  |
|                    | ACK                  |  |  |  |
| Byte 1             |                      |  |  |  |
|                    | ACK                  |  |  |  |
| Byte 2             |                      |  |  |  |
|                    | ACK                  |  |  |  |
| Byte 3             | 1011                 |  |  |  |
| 54                 | ACK                  |  |  |  |
| Byte 4             | 401/                 |  |  |  |
| Dido F             | ACK                  |  |  |  |
| Byte 5             | ACK                  |  |  |  |
| Byte 6             | ACK                  |  |  |  |
| byte 6             | ACK                  |  |  |  |
| Stop Bit           | ACK                  |  |  |  |
| Otop Dit           |                      |  |  |  |

### How to Read:

- Controller (host) will send start bit.
- Controller (host) sends the read address D3 (H)
- ICS clock will acknowledge
- ICS clock will send the *byte count*
- Controller (host) acknowledges
- ICS clock sends first byte (Byte 0) through byte 6
- Controller (host) will need to acknowledge each byte
- Controller (host) will send a stop bit

| How to Read:      |                      |  |  |  |  |
|-------------------|----------------------|--|--|--|--|
| Controller (Host) | ICS (Slave/Receiver) |  |  |  |  |
| Start Bit         |                      |  |  |  |  |
| Address           |                      |  |  |  |  |
| D3 <sub>(H)</sub> |                      |  |  |  |  |
|                   | ACK                  |  |  |  |  |
|                   | Byte Count           |  |  |  |  |
| ACK               |                      |  |  |  |  |
|                   | Byte 0               |  |  |  |  |
| ACK               |                      |  |  |  |  |
|                   | Byte 1               |  |  |  |  |
| ACK               |                      |  |  |  |  |
|                   | Byte 2               |  |  |  |  |
| ACK               |                      |  |  |  |  |
|                   | Byte 3               |  |  |  |  |
| ACK               |                      |  |  |  |  |
|                   | Byte 4               |  |  |  |  |
| ACK               |                      |  |  |  |  |
|                   | Byte 5               |  |  |  |  |
| ACK               |                      |  |  |  |  |
|                   | Byte 6               |  |  |  |  |
| ACK               |                      |  |  |  |  |
| Stop Bit          |                      |  |  |  |  |

- 1. The ICS clock generator is a slave/receiver, I<sup>2</sup>C component. It can read back the data stored in the latches for verification. **Read-Back will support Intel PIIX4 "Block-Read" protocol**.
- 2. The data transfer rate supported by this clock generator is 100K bits/sec or less (standard mode)
- 3. The input is operating at 3.3V logic levels.
- 4. The data byte format is 8 bit bytes.
- 5. To simplify the clock generator I<sup>2</sup>C interface, the protocol is set to use only "**Block-Writes**" from the controller. The bytes must be accessed in sequential order from lowest to highest byte with the ability to stop after any complete byte has been transferred. The Command code and Byte count shown above must be sent, but the data is ignored for those two bytes. The data is loaded until a Stop sequence is issued.
- 6. At power-on, all registers are set to a default condition, as shown.

### CPU\_STOP# Timing Diagram

CPU\_STOP# is an asychronous input to the clock synthesizer. It is used to turn off the CPU clocks for low power operation. CPU\_STOP# is synchronized by the **ICS9248-128**. The minimum that the CPU clock is enabled (CPU\_STOP# high pulse) is 100 CPU clocks. All other clocks will continue to run while the CPU clocks are disabled. The CPU clocks will always be stopped in a low state and start in such a manner that guarantees the high pulse width is a full pulse. CPU clock on latency is less than 4 CPU clocks and CPU clock off latency is less than 4 CPU clocks.

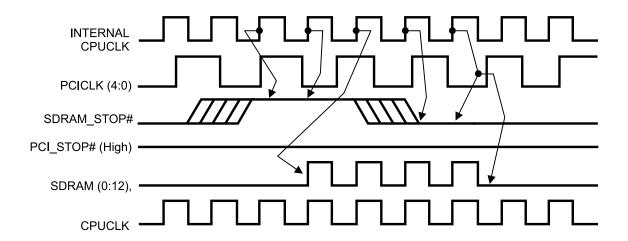

- 1. All timing is referenced to the internal CPU clock.
- 2. CPU\_STOP# is an asynchronous input and metastable conditions may exist. This signal is synchronized to the CPU clocks inside the ICS9248-128.
- 3. All other clocks continue to run undisturbed. (including SDRAM outputs).

### SDRAM\_STOP# Timing Diagram

SDRAM\_STOP# is an sychronous input to the clock synthesizer. It is used to turn off the CPU clocks for low power operation. SDRAM\_STOP# is synchronized by the ICS9248-128. All other clocks will continue to run while the SDRAM clocks are disabled. The SDRAM clocks will always be stopped in a low state and start in such a manner that guarantees the high pulse width is a full pulse.

- 1. All timing is referenced to the internal CPU clock.
- 2. SDRAM is an asynchronous input and metastable conditions may exist. This signal is synchronized to the SDRAM clocks inside the ICS9248-128.
- 3. All other clocks continue to run undisturbed.

### PCI\_STOP# Timing Diagram

PCI\_STOP# is an synchronous input to the ICS9248-128. It is used to turn off the PCICLK (0:4) clocks for low power operation. PCI\_STOP# is synchronized by the ICS9248-128 internally. The minimum that the PCICLK (0:4) clocks are enabled (PCI\_STOP# high pulse) is at least 10 PCICLK (0:4) clocks. PCICLK (0:4) clocks are stopped in a low state and started with a full high pulse width guaranteed. PCICLK (0:4) clock on latency cycles are only one rising PCICLK clock off latency is one PCICLK clock.

- 1. All timing is referenced to the Internal CPUCLK (defined as inside the ICS9248 device.)
- PCI\_STOP# is an asynchronous input, and metastable conditions may exist. This signal is required to be synchronized inside the ICS9248.
- 3. All other clocks continue to run undisturbed.
- 4. CPU\_STOP# is shown in a high (true) state.

# Shared Pin Operation - Input/Output Pins

The I/O pins designated by (input/output) on the ICS9248-128 serve as dual signal functions to the device. During initial power-up, they act as input pins. The logic level (voltage) that is present on these pins at this time is read and stored into a 5-bit internal data latch. At the end of Power-On reset, (see AC characteristics for timing values), the device changes the mode of operations for these pins to an output function. In this mode the pins produce the specified buffered clocks to external loads.

To program (load) the internal configuration register for these pins, a resistor is connected to either the VDD (logic 1) power supply or the GND (logic 0) voltage potential. A 10 Kilohm (10K) resistor is used to provide both the solid CMOS programming voltage needed during the power-up programming period and to provide an insignificant load on the output clock during the subsequent operating period.

Figure 1 shows a means of implementing this function when a switch or 2 pin header is used. With no jumper is installed the pin will be pulled high. With the jumper in place the pin will be pulled low. If programmability is not necessary, than only a single resistor is necessary. The programming resistors should be located close to the series termination resistor to minimize the current loop area. It is more important to locate the series termination resistor close to the driver than the programming resistor.

Fig. 1

#### **General Layout Precautions:**

- 1) Use a ground plane on the top layer of the PCB in all areas not used by traces.
- Make all power traces and ground traces as wide as the via pad for lower inductance.

#### **Notes:**

- All clock outputs should have a series terminating resistor, and a 20pF capacitor to ground between the resistor and clock pin. Not shown in all places to improve readibility of diagram.
- 2) Optional crystal load capacitors are recommended. They should be included in the layout but not inserted unless needed.
