APPLICATIONS:

- 3.3V High Speed Bus Switching, Multiplexing, and Bus Isolation

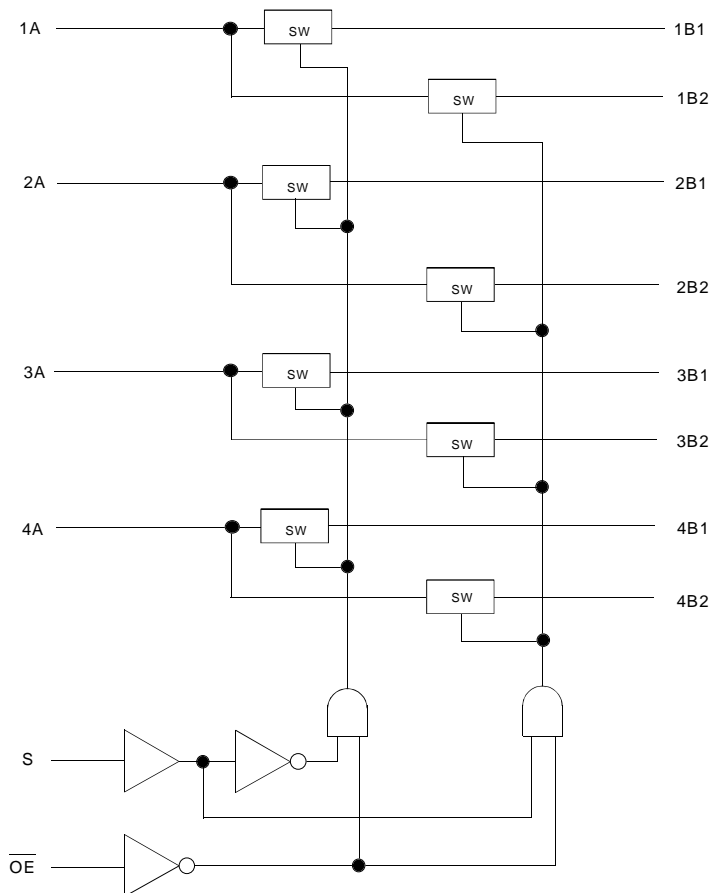

DESCRIPTION:

The CBTLV3257 is a quad 2:1 multiplexer/demultiplexer. The low on-state resistance of the switch allows connections to be made with minimal propagation delay.

The select (S) input controls the data flow. The multiplexers/demultiplexers are enabled when the output-enable (\overline{OE}) input is low.

To ensure the high-impedance state during power up or power down, \overline{OE} should be tied to V_{CC} through a pullup resistor; the minimum value of the resistor is determined by the current-sinking capability of the driver.

NOTES:

1. Stresses greater than those listed under ABSOLUTE MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

			$I_O = 15\text{mA}$	—	10	15	

NOTES:

1. Typical values are at $V_{CC} = 3.3V$, $+25^\circ\text{C}$ ambient.
2. The increase in supply current is attributable to each input that is at the specified voltage level rather than V_{CC} or GND.
3. This is measured by the voltage drop between the A and B terminals at the indicated current through the switch. On-state resistance is determined by the lower of the voltages of the two (A or B) terminals.
