

20-BIT BUS SWITCH

FEATURES:

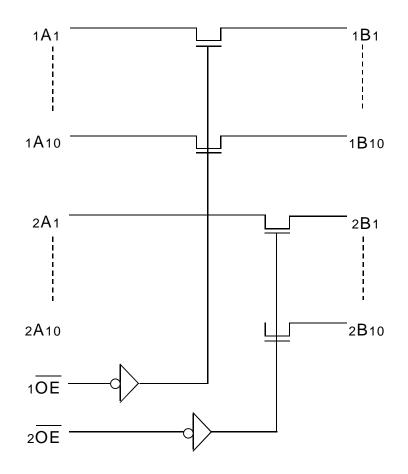

- Bus switches provide zero delay paths
- Extended commercial range of -40°C to +85°C
- Low switch on-resistance
- TTL-compatible input and output levels
- ESD > 2000V per MIL-STD-883, Method 3015; > 200V using machine model (C = 200pF, R = 0)
- Available in SSOP, TSSOP, and TVSOP Packages
- Hot insertion capability
- Very low power dissipation

DESCRIPTION:

The FST163210 belong to IDT's family of Bus switches. Bus switch devices perform the function of connecting or isolating two ports without providing any inherent current sink or source capability. Thus they generate little or no noise of their own while providing a low resistance path for an external driver. These devices connect input and output ports through an n-channel FET. When the gate-to-source junction of this FET is adequately forward-biased the device conducts and the resistance between input and output ports is small. Without adequate bias on the gate-to-source junction of the FET, the FET is turned off, therefore with no VCC applied, the device has hot insertion capability.

The low on-resistance and simplicity of the connection between input and output ports reduces the delay in this path to close to zero.

NOTES:

 Stresses greater than those listed under ABSOLUTE MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

		fi = 10MHz 50% Duty Cycle	VIN = 3.4 VIN = GND	—	2.9	4.7	

NOTES:

1. For conditions shown as Max. or Min., use appropriate value specified under Electrical Characteristics for the applicable device type. TA = -40°C to +85°C

2. Typical values are at Vcc = 5.0V, +25°C ambient.

3. Per TTL driven input (VIN = 3.4V). All other inputs at Vcc or GND. Switch inputs do not contribute to ∆Icc.

4. This parameter represents the current required to switch the internal capacitance of the control inputs at the specified frequency.

Switch inputs generate no significant power supply currents as they transition. This parameter is not directly testable, but is derived for use in Total Power Supply Calculations.

5. CPD = ICCD/VCC

CPD = Power Dissipation Capacitance

- 6. IC = IQUIESCENT + INPUTS + IDYNAMIC
 - $IC = ICC + \Delta ICC DHNT + ICCD (fiN)$
 - Icc = Quiescent Current

 Δ Icc = Power Supply Current for a TTL High Input (VIN = 3.4V)

DH = Duty Cycle for TTL Inputs High

NT = Number of TTL Inputs at DH

ICCD = Dynamic Current Caused by an Input Transition Pair (HLH or LHL)

fi = Control Input Frequency

N = Number of Control Inputs Toggling at fi

SWITCHING CHARACTERISTICS OVER OPERATING RANGE

tPLZ	xOE to A or B					
Qci	Charge Injection During Switch DISCONNECT, xOE to A or B ⁽³⁾	_	1.5	_	_	рС

NOTES:

1. See test circuits and waveforms.

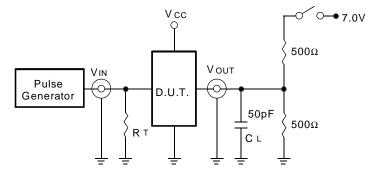

2. The bus switch contributes no Propagation Delay other than the RC Delay of the load interacting with the RC of the switch.

3. |QCI| is the charge injection for a single switch DISCONNECT and applies to either single switches or multiplexers.

QDCI is the charge injection for a multiplexer as the multiplexed port switches from one path to another. Charge injection is reduced because the injection from the DISCONNECT of the first path is compensated by the CONNECT of the second path.

DEFINITIONS:

- CL = Load capacitance: includes jig and probe capacitance.
- RT = Termination resistance: should be equal to ZOUT of the Pulse Generator.

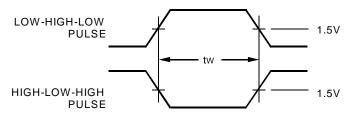

CHARGE INJECTION

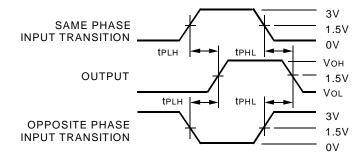

NOTES:

- 1. Select is used with multiplexers for measuring IQDCII during multiplexer select. During all other tests Enable is used.
- 2. Used with multiplexers to measure IQDCII only.
- 3. Charge Injection = Δ Vout CL, with Enable toggling for IQcII or Select toggling for IQDCII. Δ Vout is the change in Vout and is measured with a 10M Ω probe.
