MAX3314

## General Description

The MAX3314 is a ±5V powered EIA/TIA-232-compatible interface. It has one transmitter and one receiver in a flow-through architecture. The transmitter has a low-dropout output stage providing minimum RS-232-compatible ±3.7V output levels while driving 3kΩ and 1000pf at 460kbps. Both +5V and -5V are supplied externally.

The MAX3314 has a  $\overline{\text{SHDN}}$  function that reduces supply current to 1μA. The transmitter is disabled and put into 3-state mode while the receiver remains active.

The MAX3314 is available in 8-pin SOT23, μMAX and SO packages.

## Features

- ◆ 1μA Low-Power Shutdown with Receiver Active
- ◆ 30μA Operating Supply Current
- ◆ 460kbps (min) Data Rate
- ◆ 8-Pin SOT23 Package
- ◆ RS-232-Compatible Levels

## Ordering Information

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

## Detailed Description

### RS-232-Compatible Drivers

The transmitter is an inverting level translator that converts CMOS-logic levels to EIA/TIA-232-compatible levels. It guarantees data rates up to 460kbps with worst-case loads of 3k $\Omega$  in parallel with 1000pF. When  $\overline{\text{SHDN}}$  is driven low, the transmitter is disabled and put into 3-state mode. The transmitter input does not have a pull-up resistor. Connect to ground if unused.

### RS-232-Compatible Receivers

The MAX3314's receiver converts RS-232 signals to CMOS-logic output levels. The receiver is rated to signals up to  $\pm 25\text{V}$ . The MAX3314's receiver will remain active during shutdown mode.

### MAX3314 Shutdown Mode

In shutdown mode, the transmitter output is put into high impedance. This reduces the supply current to 1 $\mu\text{A}$ . The time required to exit shutdown is less than 2.5 $\mu\text{s}$ . Table 1 is the shutdown logic truth table.

**Table 1. Shutdown Logic Truth Table**

$\overline{\text{SHDN}}$	TRANSMITTER OUTPUT	RECEIVER OUTPUT
L	High-Z	Active
H	Active	Active

## Applications Information

### Capacitor Selection

The capacitor type used is not critical for proper operation; either polarized or nonpolarized capacitors are acceptable. If polarized capacitors are used, connect polarity as shown in the *Typical Operating Circuit*.

Bypass  $V_{CC}$  and  $V_-$  to ground with at least 0.1 $\mu\text{F}$ .

### Transmitter Output When Exiting Shutdown

Figure 1 shows the transmitter output when exiting shutdown mode. The transmitter is loaded with 3k $\Omega$  in parallel with 1000pF. The transmitter output displays no ringing or undesirable transients as the MAX3314 comes out of shutdown. Note that the transmitter is enabled only when the magnitude of  $V_-$  exceeds approximately -3V.

### High Data Rates

The MAX3314 maintains minimum RS-232-compatible  $\pm 3.7\text{V}$  transmitter output voltage even at high data rates.

Figure 2 shows a transmitter loopback test circuit. Figure 3 shows the loopback test result at 120kbps, and Figure 4 shows the same test at 250kbps.
