### **General Description**

The MAX9989 and MAX9990 LO buffers provide the high output (+14dBm to +20dBm) necessary to drive the LO inputs of high-linearity passive mixers, while offering 40dB reverse isolation to prevent LO pulling. The MAX9989 is internally matched for the cellular/GSM bands, and the MAX9990 is matched for the DCS/PCS/UMTS bands.

The *Typical Application Circuit* provides a nominal +17dBm output power with  $\pm$ 1dB variation over supply, temperature, and input power. With two optional resistors, the output power can be precision set from +14dBm to +20dBm. The devices offer more than 35dB main driver output to PLL amp output isolation. Each device is offered in a 5mm × 5mm 20-pin thin QFN package with exposed paddle.

#### **Applications**

Cellular/GSM/DCS/PCS/UMTS Base Station Tx/Rx LO Drives Coherent Receivers ISM Wireless LAN Wireless Local Loop Local Multipoint Distribution Service Point-to-Point Systems

#### **Features**

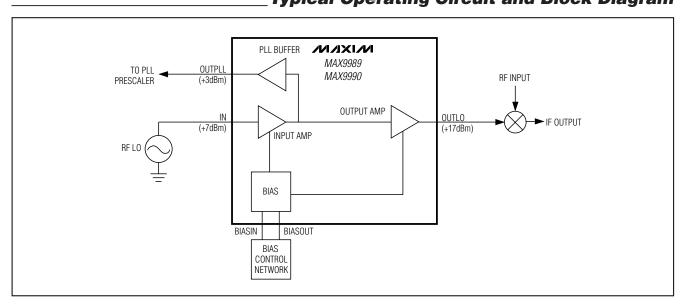

- ♦ ±1dB Output Power Variation
- +14dBm to +20dBm Adjustable Output Power
- ♦ 40dB Reverse Isolation
- Better Than 35dB Main Driver Output to PLL Amp Output Isolation
- Low Output Noise: -170dBc/Hz at +17dBm
- 110mA Supply Current at +17dBm
- ESD Protection
- Isolated PLL Output (+3dBm)

#### **Ordering Information**

PART	TEMP RANGE	PIN- PACKAGE	FREQUENCY RANGE (MHz)
MAX9989ETP	-40°C to +85°C	20 Thin QFN-EP*	700 to 1100
MAX9990ETP	-40°C to +85°C	20 QFN-EP*	1500 to 2200

\*EP = Exposed paddle.

Typical Application Circuit/Pin Configuration appears at end of data sheet.

MAX9989/MAX9990

### **Pin Description**

PIN	NAME	FUNCTION
1, 4, 8, 9, 13–18, EP	GND	Ground. Provide 5–10 plated vias from EP to system ground plane for optimal thermal and RF performance.
2	IN	Input. Internally matched 50 $\Omega$ RF input. AC couple to this pin so as not to disturb input bias level.
3	VCCREF	Supply. Supply connection for on-chip voltage and current references. See <i>Applications Information</i> for information on decoupling.
5	REF	Voltage Reference Output. Output for on-chip 1.5V bandgap voltage reference. See the <i>Applications Information</i> section for information on decoupling.
6	BIASIN	Bias Connection for Input Buffer. Set compressed power point for input amplifier with a resistor to REF or GND. For +17dBm output power, no external biasing resistors are required. See the <i>Applications Information</i> section for more information.
7	BIASOUT	Bias Connection for LO Output Amplifier. Set compressed power point for OUTLO with a resistor to REF or ground. For +17dBm output power, no external biasing resistors are required. See the <i>Applications Information</i> section for more information.
10	OUTLO	LO Output. Internally matched 50 $\Omega$ RF output. AC couple to this pin so as not to disturb output bias level.
11, 12	VCC2	Supply. Supply connection for OUTLO.
19	VCC1	Supply. Supply connection for input amplifier.
20	OUTPLL	PLL Output. Output for driving optional external PLL. Requires external $100\Omega$ pullup to V <sub>CC</sub> for bias. For applications not requiring the PLL driver, removing R1 leaves OUTPLL unbiased, saving about 12mA current.

### \_Detailed Description

The MAX9989/MAX9990 LO buffers each consist of a single-input amplifier, an output amplifier, and a second buffer amplifier to drive the LO's PLL. The bias currents for the amplifiers are adjustable through off-chip resistors, allowing the output level to be precision set anywhere from +14dBm to +20dBm. The PLL output is preset to +3dBm (about 900mV<sub>P-P</sub> into 50 $\Omega$ ).

Power levels are typically ±1dB over the full supply, input power, and temperature range. Precision power control is achieved by internal control circuitry. Maintaining tight power control keeps the system engineer from over specifying the LO drive in order to guarantee a linearity specification in the base-station mixer. More than 40dB isolation between the LO output and the input prevents VCO pulling.

The MAX9989 is specified from 700MHz to 1100MHz, and the MAX9990 is specified from 1500MHz to 2200MHz. Both are offered in compact 5mm × 5mm 20-pin QFN thin packages with EP.

### Input Amplifier

A single low-noise input amplifier provides gain and isolation. The compressed output power for this stage is controlled by the bias setting resistors R2 or R4 (see the *Typical Application Circuit*). These resistors are not required for the nominal +17dBm output; see Table 1 for bias resistor values to obtain +14dBm to +20dBm output power.

The input is internally matched to  $50\Omega$ , and typical VSWR is no more than 2:1 over all operating conditions. Since the input is internally biased, provide a DC block at the input pin.

#### **PLL Amplifier and Output**

A small amount of power is tapped off from the input amplifier's output, and fed to a high-isolation buffer to drive the PLL output at about +3dBm. If the PLL output is not required, it can be disabled by removing R1; disabling the PLL output saves 12mA supply current.

NOMINAL OUTPUT POWER (dBm)	<b>R2 (k</b> Ω)	R4 (kΩ)	<b>R3 (k</b> Ω)	<b>R5 (k</b> Ω)	MAX9989 INPUT DRIVE (dBm)	MAX9990 INPUT DRIVE (dBm)

+14	Open	0.6	Open	0.6	4 ±3	6 ±3

#### Table 1. External Resistor Values for +14dBm to +20dBm Output Power

# Table 2. Component Values for TypicalApplication Circuit

	COMPONE	ENT VALUE
DESIGNATION	MAX9989 (LOWBAND)	MAX9990 (HIGHBAND)
C1, C2, C4, C6, C8, C9, C10	47pF	22pF
C3, C7, C11	0.1µF	0.1µF
C5	5pF	22pF
R2-R5	See Table 1	See Table 1
R1	100Ω	100Ω

#### **Output Amplifier**

The output amplifier is similar to the input amplifier, except it is biased higher to provide more output power. For example, with an input power of +10dBm, the MAX9989 can deliver +20dBm. The bias is adjustable; see Table 1 for details.

The RF output is internally matched to  $50\Omega$ , with a typical VSWR limit of 2:1. Provide DC-blocking capacitors at the outputs.

### **Applications Information**

#### **Input and Output Matching**

All input and output matching is accomplished on chip; no external matching circuitry is required. Use a DC block of about 47pF (low band) or 22pF (high band) at the input and the outputs. Because these parts are internally broadband matched, adjusting external component values can optimize performance for a particular band.

#### **Input Drive Level**

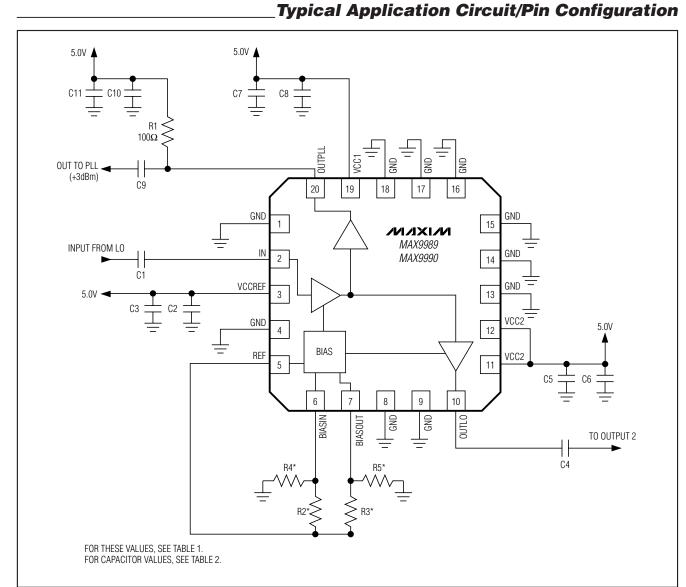

In the case of the MAX9989, the typical required input drive level is +7dBm for +17dBm output, or +10dBm for +20dBm output. The MAX9990 uses slightly higher input levels (see Table 1). The typical VCO cannot provide sufficient drive by itself; the typical application follows the VCO with attenuation (about +3dB), and then with a low-noise gain block. This allows the VCO to drive the MAX9989/MAX9990 input at the required level without being load-pulled.

#### **Output Drive Level**

The output drive of the MAX9989/MAX9990 is nominally +17dBm  $\pm 1$ dB. This is the typical application, with no external bias-setting resistors at INBIAS and OUTBIAS. Output power can be set from +14dBm to +20dBm by using the bias-setting resistor values listed in Table 1.
