

M51132L/FP**2CH ELECTRONIC VOLUME-BALANCE****DESCRIPTION**

The M51132 is a VCA (Voltage Controlled Amplifier) IC developed as an electronic volume control for audio-visual equipment. The IC is used to process small analog signals at the stage before power amplifier. Right/left independent volume control or right/left simultaneous volume control can be selected by DC voltages. Its built-in pass through function, in combination with an ALC amplifier, offers the capability of automatic level control.

FEATURES

- Two control modes can be selected.
(Left/right independent volume control mode or left/right simultaneous volume + balance control mode).
- Pass through switch is included to output the input signal as it is, irrespective of the volume/balance control voltages.
- Shock noise reduction pin is provided to reduce pass through switch on/off shock noise.
- Built-in reference supply voltage circuit
..... output current 10mA (typ)
- Maximum input.....3.4Vrms (typ)
(f = 1kHz, THD = 1%)
