

## ML9205-01

### 5 × 7 Dot Character × 16-Digit Display Controller/Driver with Character RAM

#### GENERAL DESCRIPTION

The ML9205-01 is a dot matrix vacuum fluorescent display tube controller driver IC which displays characters, numerics and symbols.

Dot matrix vacuum fluorescent display tube drive signals are generated by serial data sent from a micro-controller. A display system is easily realized by internal ROM and RAM for character display.

#### FEATURES

- Logic power supply ( $V_{DD}$ ) : 3.3 V $\pm$ 10% or 5.0 V $\pm$ 10%
- Fluorescent display tube drive power supply ( $V_{DISP}$ ) : 3.3 V $\pm$ 10% or 5.0 V $\pm$ 10%
- Fluorescent display tube drive power supply ( $V_{FL}$ ) : -20 to -60 V
- VFD driver output current  
(VFD driver output can be connected directly to the fluorescent display tube. No pull-down resistor is required.)
  - Segment driver (SEG1 to SEG35) : -5.0 mA ( $V_{FL} = -60$  V)
  - Segment driver (AD1 to AD4) : -10.0 mA ( $V_{FL} = -60$  V)
  - Grid driver (COM1 to COM24) : -50.0 mA ( $V_{FL} = -60$  V)
- General output port output current
  - Output driver (P1 to P4) :  $\pm 1.0$  mA ( $V_{DD} = 3.3$  V $\pm$ 10%)  
 $\pm 2.0$  mA ( $V_{DD} = 5.0$  V $\pm$ 10%)
- Content of display
  - CGROM 5 × 7 dots : 240 types (character data)
  - CGRAM 5 × 7 dots : 16 types (character data)
  - ADRAM 24 (display digit) × 4 bits (symbol data)
  - DCRAM 24 (display digit) × 8 bits (register for character data display)
  - General output port 4 bits (static operation)
- Display control function
  - Display digit : 9 to 24 digits
  - Display duty (brightness adjustment) : 8 stages
  - All lights ON/OFF
- 3 interfaces with microcontroller : DA,  $\overline{CS}$ ,  $\overline{CP}$  (4 interfaces when  $\overline{RESET}$  is added)
- 1-byte instruction execution (excluding data write to RAM)
- Built-in oscillation circuit (external R and C)
- Package options:
  - 80-pin QFP package (QFP80-P-1414-0.65-K) (Product name : ML9205-01GP)
  - 80-pin QFP package (QFP80-P-1420-0.80-BK) (Product name : ML9205-01GA)

## PIN DESCRIPTION

Pin		Symbol	Type	Connects to	Description
QFP-1*	QFP-2*				
3 to 37	5 to 39	SEG1 to 35	0	Fluorescent tube anode electrode	Fluorescent display tube anode electrode drive output. Directly connected to fluorescent display tube and a pull-down resistor is not necessary. $I_{OH} > -5.0$ mA
39 to 62	41 to 64	COM1 to 24	0	Fluorescent tube grid electrode	Fluorescent display tube grid electrode drive output. Directly connected to fluorescent display tube and a pull-down resistor is not necessary. $I_{OH} > -50.0$ mA
1, 2, 79, 80	1 to 4	AD1 to AD4	0	Fluorescent tube anode electrode	Fluorescent display tube anode electrode drive output. Directly connected to fluorescent display tube and a pull-down resistor is not necessary. $I_{OH} > -10.0$ mA
72 to 75	74 to 77	P1 to P4	0	LED anode electrode	General port output. Output of these pins in static operation, so these pins can drive the LED. $I_{OH} > -2.0$ mA
71	73	$V_{DD}$	—	Power supply	$V_{DD}$ -GND are power supplies for internal logic. $V_{DISP}$ - $V_{FL}$ are power supplies for driving fluorescent tubes. Use the same power supply for $V_{DD}$ and $V_{DISP}$ .

3	ADRAM data write	X0	X1	X2	X3	X4	1	1	0	C0	C1	C2	C3	*	*	*	*	
4	General output port set	P1	P2	P3	P4	*	0	0	1	* : Don't care								
5	Display duty set	D0	D1	D2	*	*	1	0	1	Xn : Address specification for each RAM								
6	Number of digits set	K0	K1	K2	K3	*	0	1	1	Cn : Character code specification for each RAM								
7	All lights ON/OFF	L	H	*	*	*	1	1	1	Pn : General output port status specification								
	Test mode									Dn : Display duty specification								
										Kn : Number of digits specification								
										H : All lights ON instruction								
										L : All lights OFF instruction								

When data is written to RAM (DCRAM, CGRAM, ADRAM) continuously, addresses are internally incremented automatically.

Therefore it is not necessary to specify the 1st byte to write RAM data for the 2nd and later bytes.

Note: The test mode is used for inspection before shipment.  
It is not a user function.

Positional Relationship Between SEGn and ADn (one digit)

## Data Transfer Method and Command Write Method

Display control command and data are written by an 8-bit serial transfer. Write timing is shown in the figure below.

Setting the  $\overline{CS}$  pin to "Low" level enables a data transfer.

Data is 8 bits and is sequentially input into the DA pin from LSB (LSB first).

As shown in the figure below, data is read by the shift register at the rising edge of the shift clock, which is input into the  $\overline{CP}$  pin. If 8-bit data is input, internal load signals are automatically generated and data is written to each register and RAM.

Therefore it is not necessary to input load signals from the outside.

Setting the  $\overline{CS}$  pin to "High" disables data transfer. Data input from the point when the  $\overline{CS}$  pin changes from "High" to "Low" is recognized in 8-bit units.

- \* When data is written to RAM (DCRAM, ADRAM, CGRAM) continuously, addresses are internally incremented automatically. Therefore it is not necessary to specify the 1st byte to write RAM data for the 2nd and later bytes.

## Reset Function

Reset is executed when the  $\overline{RESET}$  pin is set to "L", (when turning power on, for example) and initializes all functions.

Initial status is as follows:

- Address of each RAM ..... address "00"H
- Data of each RAM ..... All contents are undefined
- General output port ..... All general output ports go "Low"
- Display digit ..... 24 digits
- Brightness adjustment ..... 8/16
- All display lights ON or OFF ..... OFF mode
- Segment output ..... All segment outputs go "Low"
- AD output ..... All AD outputs go "Low"

Please set the functions again according to "Setting Flowchart" after reset.

## Description of Commands and Functions

1. DCRAM data write  
(Specifies the addresses 00H to 1FH of DCRAM and writes the character codes of CGROM and CGRAM.)

DCRAM (Data Control RAM) has a 5-bit address to store the character codes of CGROM and CGRAM.

The character code specified by DCRAM is converted to a  $5 \times 7$  dot matrix character pattern via CGROM or CGRAM.

(The DCRAM can store 24 characters.)

[Command format]

	LSB							MSB	
	B0	B1	B2	B3	B4	B5	B6	B7	
1st byte (1st)	X0	X1	X2	X3	X4	1	0	0	: selects DCRAM data write mode and specifies DCRAM address (Ex: Specifies DCRAM address 00H.)
	LSB							MSB	
	B0	B1	B2	B3	B4	B5	B6	B7	
2nd byte (2nd)	C0	C1	C2	C3	C4	C5	C6	C7	: specifies the character codes of CGROM and CGRAM (written into DCRAM address 00H)

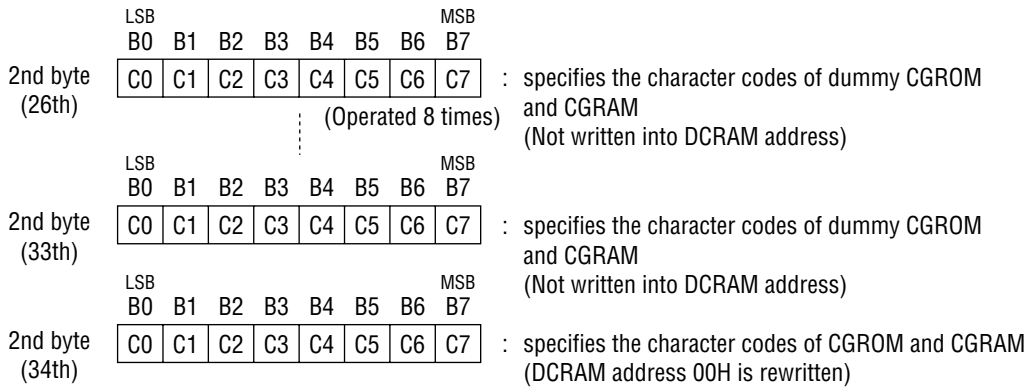

To specify the character code of CGROM and CGRAM continuously to the next address, specify only character codes as follows.

The addresses of DCRAM are automatically incremented. Specification of an address is unnecessary.

	LSB							MSB	
	B0	B1	B2	B3	B4	B5	B6	B7	
2nd byte (3rd)	C0	C1	C2	C3	C4	C5	C6	C7	: specifies the character codes of CGROM and CGRAM (written into DCRAM address 01H)
	LSB							MSB	
	B0	B1	B2	B3	B4	B5	B6	B7	
2nd byte (4th)	C0	C1	C2	C3	C4	C5	C6	C7	: specifies the character codes of CGROM and CGRAM (written into DCRAM address 02H)
			⋮						
	LSB							MSB	
	B0	B1	B2	B3	B4	B5	B6	B7	
2nd byte (25th)	C0	C1	C2	C3	C4	C5	C6	C7	: specifies the character codes of CGROM and CGRAM (written into DCRAM address 17H)

The character code setting of CGROM and CGRAM up to 24 digits is completed.  
 To set a character code from DCRAM address 00H continuously.  
 Specify a dummy character code between DCRAM addresses 18H and 1FH.  
 (To increment the DCRAM address automatically and set it to 00H)

X0 (LSB) to X4 (MSB): DCRAM addresses (5 bits: 24 characters)

C0 (LSB) to C7 (MSB): Character codes of CGROM and CGRAM (8 bits: 256 characters)

## 2. CGRAM data write

(Specifies the addresses of CGRAM and writes character pattern data.)

CGRAM (Character Generator RAM) has a 4-bit address to store  $5 \times 7$  dot matrix character patterns.

A character pattern stored in CGRAM can be displayed by specifying the character code (address) by DCRAM.

The address of CGRAM is assigned to 00H to 0FH. (All the other addresses are the CGROM addresses.)

(The CGRAM can store 16 types of character patterns.)

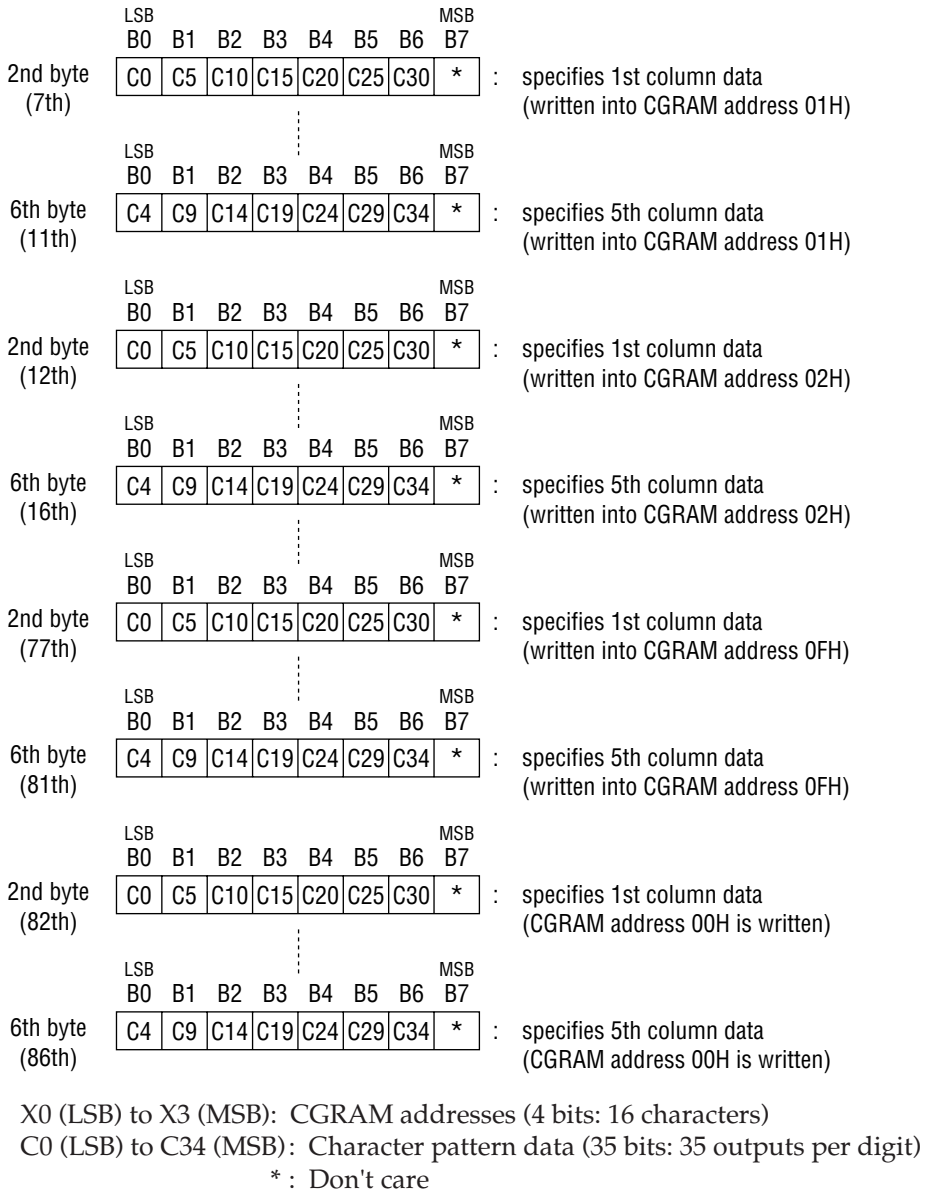

[Command format]

5th byte (5th)	C3	C8	C13	C18	C23	C28	C33	*			: specifies 4th column data (written into CGRAM address 00H)
	LSB									MSB	
	B0	B1	B2	B3	B4	B5	B6	B7			
6th byte (6th)	C4	C9	C14	C19	C24	C29	C34	*			: specifies 5th column data (written into CGRAM address 00H)

To specify character pattern data continuously to the next address, specify only character pattern data as follows.

The addresses of CGRAM are automatically incremented. Specification of an address is therefore unnecessary.

The 2nd to 6th byte (character pattern data) are regarded as one data item, so 300 ns is sufficient for  $t_{\text{DOFF}}$  time between bytes.

Positional relationship between the output area of CGROM and that of CGRAM

Note: CGROM (Character Generator ROM) has an 8-bit address to generate  $5 \times 7$  dot matrix character patterns.

CGRAM can store 240 types of character patterns.

## 3. ADRAM data write

(Specifies the addresses 00H to 1FH of ADRAM and writes symbol data.)

ADRAM (Additional Data RAM) has a 5-bit address to store symbol data.

Symbol data specified by ADRAM is directly output without CGROM and CGRAM.

(The ADRAM can store 4 types of symbol patterns for each digit.)

The terminal to which the contents of ADRAM are output can be used as a cursor.

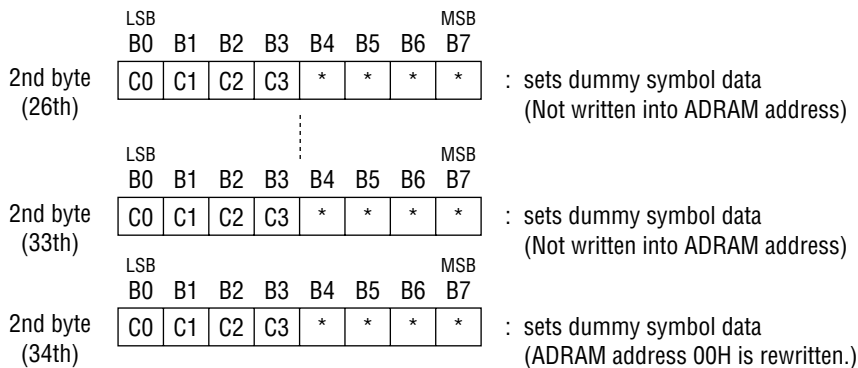

[Command format]

	LSB	B0	B1	B2	B3	B4	B5	B6	B7	MSB	
1st byte (1st)	X0	X1	X2	X3	X4	1	1	0			: selects ADRAM data write mode and specifies ADRAM address (Ex: Specifies ADRAM address 00H.)

2nd byte (25th)	C0	C1	C2	C3	*	*	*	*			: sets symbol data (written into ADRAM address 17H)

The symbol data setting up to 24 digits is completed.  
 To set symbol data from ADRAM address 00H continuously.  
 Specify a dummy symbol data between ADRAM addresses 18H and 1FH.  
 (To increment the ADRAM address automatically and set it to 00H)

X0 (LSB) to X4 (MSB): ADRAM addresses (5 bits: 24 characters)  
 C0 (LSB) to C3 (MSB): Symbol data (4 bits: 4-symbol data per digit)

4. General output port set  
(Specifies the general output port status.)

The general output port is an output for 4-bit static operation.

It is used to control other I/O devices and turn on LED. (static operation)

When at the "High" level, this output becomes the  $V_{DD}$  voltage, and when at the "Low" level, it becomes the ground potential. Therefore, the fluorescent display tube cannot be driven.

[Command format]

	LSB							MSB	
	B0	B1	B2	B3	B4	B5	B6	B7	
1st byte	P1	P2	P3	P4	*	0	0	1	: selects a general output port and specifies the output status

P1 to P4 : general output ports

\* : Don't care

[Set data and set state of general output port]

Pn	Display state of general output port
0	Sets the output to Low
1	Sets the output to High

(The state when power is applied or when  $\overline{\text{RESET}}$  is input.)

5. Display duty set  
(Writes a display duty value to the duty cycle register.)

Display duty adjusts brightness in 8 stages using 3-bit data.

When power is turned on or when the  $\overline{\text{RESET}}$  signal is input, the duty cycle register value is "0". Always execute this instruction before turning the display on, then set a desired duty value.

[Command format]

LSB	B0	B1	B2	B3	B4	B5	B6	B7	MSB
1st byte	D0	D1	D2	*	*	1	0	1	: selects display duty set mode and sets duty value

7	1	1	1	15/16

← (The state when power is turned on or when  $\overline{\text{RESET}}$  signal is input.)

6. Number of digits set  
(Writes the number of display digits to the display digit register.)

The number of digits set can display 9 to 24 digits using 4-bit data.

When power is turned on or when a  $\overline{\text{RESET}}$  signal is input, the number of digit register value is "0". Always execute this instruction to change the number of digits before turning the display on.

\* The state when power is turned on or when  $\overline{\text{RESET}}$  signal is input.

7. All display lights ON/OFF set  
(Turns all display lights ON or OFF.)

All display lights ON is used primarily for display testing.

All display lights OFF is primarily used for display blink and to prevent malfunction when power is turned on.

This command cannot control the general output port.

[Command format]

	LSB							MSB	
	B0	B1	B2	B3	B4	B5	B6	B7	
1st byte	L	H	*	*	*	1	1	1	: selects all display lights ON or OFF mode and specifies display operation

APPLICATION CIRCUIT

- Notes: 1. The V<sub>DD</sub> value depends on the power supply voltage of the microcontroller used. Adjust the values of the constants R<sub>1</sub>, R<sub>2</sub>, R<sub>4</sub>, C<sub>1</sub>, and C<sub>2</sub> to the power supply voltage used.
2. The V<sub>FL</sub> value depends on the fluorescent display tube used. Adjust the values of the constants R<sub>3</sub> and ZD to the power supply voltage used.

REFERENCE DATA

Graphs illustrating the  $V_{FL}$  versus driver output current capability relationship are shown below.

Care must be taken not to use the total power in excess of allowable power dissipation.
