## 74ALVCH16240

## Low-Voltage 16-Bit Buffer with Bus Hold 1.8/2.5/3.3 V (3-State, Inverting)

The 74ALVCH16240 is an advanced performance, inverting 16-bit buffer. It is designed for very high-speed, very low-power operation in $1.8 \mathrm{~V}, 2.5 \mathrm{~V}$ or 3.3 V systems.

The 74ALVCH16240 is nibble controlled with each nibble functioning identically, but independently. The control pins may be tied together to obtain full 16-bit operation. The 3-state outputs are controlled by an Output Enable ( $\overline{\mathrm{OEn}}$ ) input for each nibble. When $\overline{\mathrm{OEn}}$ is LOW, the outputs are on. When $\overline{\mathrm{OEn}}$ is HIGH, the outputs are in the high impedance state. The data inputs include active bus-hold circuitry, eliminating the need for external pull-up resistors to hold unused or floating inputs at a valid logic state.

- Designed for Low Voltage Operation: $\mathrm{V}_{\mathrm{CC}}=1.65$ to 3.6 V
- 3.6 V Tolerant Inputs and Outputs
- High-Speed Operation: 3.0 ns Max for 3.0 to 3.6 V
3.7 ns Max for 2.3 to 2.7 V
6.0 ns Max for 1.65 to 1.95 V
- Static Drive: $\pm 24 \mathrm{~mA}$ Drive at 3.0 V
$\pm 12 \mathrm{~mA}$ Drive at 2.3 V $\pm 4 \mathrm{~mA}$ Drive at 1.65 V
- Supports Live Insertion and Withdrawal
- Includes Active Bus-Hold to Hold Unused or Floating Inputs at a Valid Logic State
- $\mathrm{I}_{\text {OFF }}$ Specification Guarantees High Impedance When $\mathrm{V}_{\mathrm{CC}}=0 \mathrm{~V} \dagger$
- Near Zero Static Supply Current in All Three Logic States ( $40 \mu \mathrm{~A}$ ) Substantially Reduces System Power Requirements
- Latchup Performance Exceeds $\pm 250 \mathrm{~mA} @ 125^{\circ} \mathrm{C}$
- ESD Performance: Human Body Model >2000V; Machine Model >200V
- Second Source to Industry Standard 74ALVCH16240
$\dagger$ To ensure the outputs activate in the 3-state condition, the output enable pins should be connected to $\mathrm{V}_{\mathrm{CC}}$ through a pull-up resistor. The value of the resistor is determined by the current sinking capability of the output connected to the $\overline{\mathrm{OE}}$ pin.

Maximum Ratings are those values beyond which damage to the device may occur. Exposure to these conditions or conditions beyond those indicated may adversely affect device reliability. Functional operation under absolute maximum-rated conditions is not implied. Functional operation should be restricted to the Recommended Operating Conditions.

1. Io absolute maximum rating must be observed.
2. Measured with minimum pad spacing on an FR4 board, using 10 mm -by-1 inch, 2-ounce copper trace with no air flow.
3. Tested to EIA/JESD22-A114-A.
4. Tested to EIA/JESD22-A115-A.
5. Tested to JESD22-C101-A.
6. Tested to EIA/JESD78.

| toshl tosth | Output-to-Output Skew (Note 11) |  |  | $\begin{aligned} & 0.5 \\ & 0.5 \end{aligned}$ |  | $\begin{aligned} & 0.5 \\ & 0.5 \end{aligned}$ |  | $\begin{aligned} & \hline 0.75 \\ & 0.75 \end{aligned}$ | ns |

10. For $\mathrm{C}_{\mathrm{L}}=50 \mathrm{pF}$, add approximately 300 ps to the AC maximum specification.
11. Skew is defined as the absolute value of the difference between the actual propagation delay for any two separate outputs of the same device. The specification applies to any outputs switching in the same direction, either HIGH-to-LOW (toshl) or LOW-to-HIGH (tosLh); parameter guaranteed by design.
