

Precision Quad Supply and Line Monitor

FEATURES

- Inputs for Monitoring Up to Four Supply Voltages
- Two Inputs Preset for -5V and -12V Monitoring, or Programmable Positive Levels
- Precision 2.5V Reference
- Separate Inputs for Over-Current and Line Fault Sensing
- Adjustable Under- to Over-Voltage Fault Windows
- Latched Over-Voltage and Over-Current Output
- Power Good and Power Warning Outputs
- Auto Restart Function with ON/OFF Control, and Programmable Delay
- Programmable Pwr On Reset Delay

DESCRIPTION

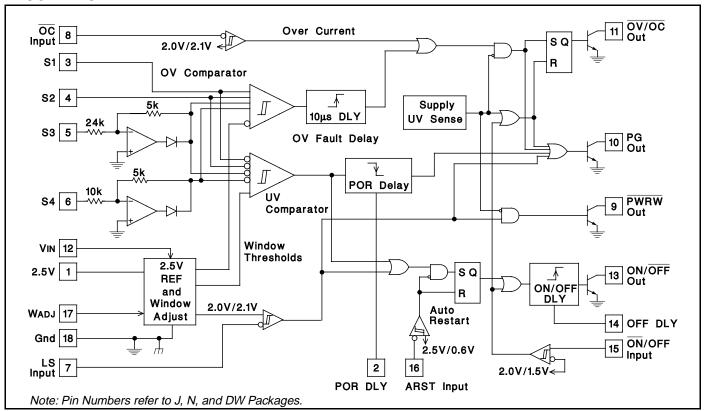

The UC1904 Quad Supply Monitor will respond to under- and over-voltage conditions on up to four continuously monitored voltage levels. Four independent positive voltages can be monitored or, alternatively, two of the sense inputs are preset to monitor -5V and -12V supplies. The device also monitors Over-Current and Line Sense inputs, both with precision input thresholds.

Four open collector outputs on the UC1904 give the following responses: 1. The OV/OC output is a latched over-voltage, or over-current response. 2. A Power Good signal responds low with any fault detection – on power-up a programmable delay is used to hold this output low for a system Power On Reset signal. 3. The PWRW output responds only to a Line Sense input, for early warning of power failures. 4. The last open collector, the ON/OFF output, generates a delayed supply OFF control signal in response to an OFF input command, under-voltage condition, or line fault detection.

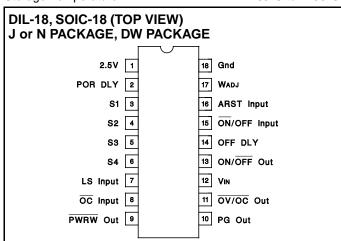

The OV-UV fault window is adjustable with a programming input. The thresholds are centered around the precision 2.5V reference, with a scaled hysteresis for precise, glitch free operation. In the positive mode of operation, the fault windows at each of the sense inputs can be independently scaled using external resistors and the 2.5V reference output. An Auto Restart function couples with the under-voltage and line sensing circuits to allow controlled power supply start-up and shutdown.

This device will operate over a supply range of 4.75V to 18V. The device is available in a DIP, SOIC, or PLCC outline. This device is ESD protected on all pins.

PIN FUNCTIONAL DESCRIPTION

2.5V: This is the output of the precision 2.5V reference.

ARST Input: This input, with a 4:1 hysteretic threshold, is used to sequence a power system through the **A**uto **ReStarT** cycle. A delayed representation of a supply output voltage is used at this pin to provide adequate startup time for the power system, and a minimum power-off period.

Gnd: Reference point for the internal reference and all thresholds, as well as the return for the remainder of the device.

LS Input: The **L**ine **S**ense input is used to monitor a voltage that varies with the input line voltage to a system. The input is compared to a precision 2.0V level and is used to activate the PWRW and PG outputs, as well as triggering the Auto Restart sequence.

OC Input: The **O**ver-**C**urrent input can be used to respond to an inverted over-current signal. A low level signal at this input latches in a fault indication at the **OV/OC** output.

OFF DLY: This pin functions similarly to the **POR DLY** pin to delay the turn-on of the ON/OFF output transistor. The charging current and upper threshold are 12μ A and 2.1V.

ON/OFF Input: With a high level at this input the ON/OFF Out pin is activated after a user-programmable delay. A high level also activates the PG Out pin, and resets the OV/OC fault latch.

On/Off Out: This output is an open collector output that is activated by the ON/OFF Input, or the Auto Restart circuitry. Saturation voltage on this and all the open collector outputs is rated at 10mA of current.

OV/OC Out: In response to either an Over-Voltage or Over-Current situation this output is latched active low. There is nominal 20μs delay in the OV path to the fault latch, providing rejection to transient overshooting on the monitored voltages. The low condition is cleared when

the fault latch is reset by the **ON/OFF Input**, or a **UVLO** condition on the device.

POR DLY: This pin is used, with an external capacitor, to program a **Power-On-Reset** delay. This delay is reset whenever there is a UV condition at one of the S1-S4 inputs, and then triggered upon the clearing of the UV condition. When reset, the voltage across the capacitor is quickly discharged to near zero volts, and the **PG Out** pin goes active low. Once triggered the capacitor is charged by a 9μ A current source. The **PG Out** pin remains active low until the delay capacitor voltage reaches a 2.1V threshold.

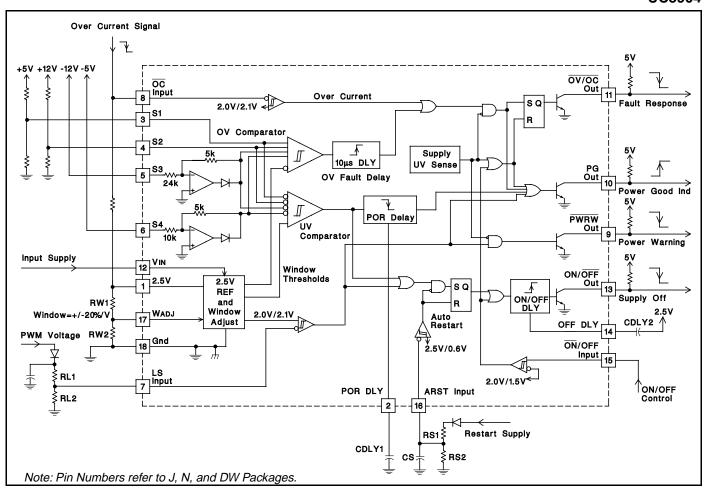

PG Out: During any fault, under-voltage, or UVLO condition this output is low. A **Power Good** indication (output off) is given when all supply conditions are within defined operating limits. During power-up the **PG** signal is delayed by a programmable **Power On Reset** delay. During **UVLO** the output is active low as long as the input supply, **VIN**, is above approximately 1.0V.

PWRW Out: When a low line condition is sensed by the **LS Input** this output goes low. This output is disabled (off) during a **UVLO** condition.

S1-S4: These are the sense inputs for OV and UV monitoring of external voltages. All four inputs can be used to sense positive voltages with a simple divider to scale the voltage level to the 2.5V centered window. The **S3** and **S4** inputs can also be used to sense -12V and -5V supplies respectively with no external components. This is done with internal precision resistor dividers and two source only op-amps that are disabled when the pins are used in the positive mode.

VIN: Input supply for the UC1904. The device is operational with 4.75V to 18V on this pin.

WADJ: The **WADJ** input is used to program the OV and UV window thresholds. The OV-UV window is centered around the 2.5V reference and is nominally $\pm 20\%$ per volt on the **WADJ** input pin.

IMPORTANT NOTICE

Texas Instruments and its subsidiaries (TI) reserve the right to make changes to their products or to discontinue any product or service without notice, and advise customers to obtain the latest version of relevant information to verify, before placing orders, that information being relied on is current and complete. All products are sold subject to the terms and conditions of sale supplied at the time of order acknowledgement, including those pertaining to warranty, patent infringement, and limitation of liability.

TI warrants performance of its semiconductor products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are utilized to the extent TI deems necessary to support this warranty. Specific testing of all parameters of each device is not necessarily performed, except those mandated by government requirements.

CERTAIN APPLICATIONS USING SEMICONDUCTOR PRODUCTS MAY INVOLVE POTENTIAL RISKS OF DEATH, PERSONAL INJURY, OR SEVERE PROPERTY OR ENVIRONMENTAL DAMAGE ("CRITICAL APPLICATIONS"). TI SEMICONDUCTOR PRODUCTS ARE NOT DESIGNED, AUTHORIZED, OR WARRANTED TO BE SUITABLE FOR USE IN LIFE-SUPPORT DEVICES OR SYSTEMS OR OTHER CRITICAL APPLICATIONS. INCLUSION OF TI PRODUCTS IN SUCH APPLICATIONS IS UNDERSTOOD TO BE FULLY AT THE CUSTOMER'S RISK.

In order to minimize risks associated with the customer's applications, adequate design and operating safeguards must be provided by the customer to minimize inherent or procedural hazards.

TI assumes no liability for applications assistance or customer product design.
