

CMOS 8–Bit Microcontrollers

TMP90PH02P/TMP90PH02M

1. Outline and Characteristics

The TMP90PH02 is a system evaluation LSI having a built in One-Time PROM for TMP90CH02.

A programming and verification for internal PROM is

achieved by using a general EPROM programmer with an adapter socket.

The function of this device is exactly same as the TMP90CH02 and TMP90C802A by programming to the internal PROM.

The differences between TMP90PH02 and TMP90C802A are the internal RAM size, and the internal PROM size.

The following are the memory map of TMP90PH02 and TMP90C802A.

3. Operation

The TMP90PH02 is the OTP version of the TMP90CH02 that is replaced an internal ROM from Mask ROM to EPROM.

The function of TMP90PH02 is exactly same as that of TMP90C802A.

Refer to the TMP90CH02 except the functions which are not described this section.

The following is an explanation of the hardware configuration and operation in the relation to the TMP90PH02.

The TMP90PH02 has an MCU mode and a PROM mode.

3.1 MCU Mode

- (1) Mode Setting and Function

The MCU mode is set by opening the CLK pin (Output status).

In the MCU mode, the operation is the same as that of TMP90CH02.

- (2) Memory Map

Figure 3.1 shows the memory map of TMP90PH02, and the accessing area by the respective addressing mode.

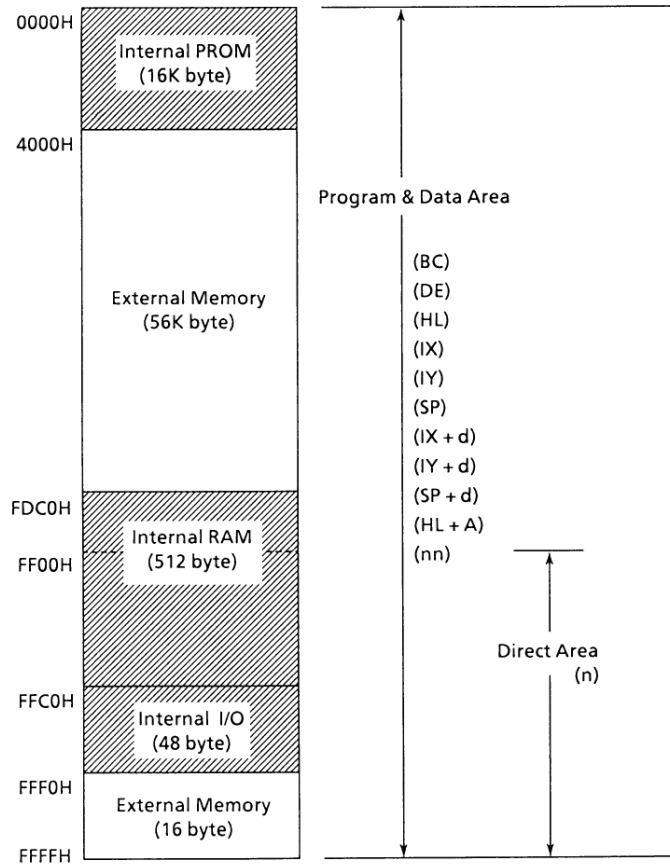

Figure 3.1. TMP90PH02 Memory Map

3.2 PROM Mode

(1) Mode Setting and Function

PROM mode is set by setting the $\overline{\text{RESET}}$ and CLK pins to the "L" level.

The programming and verification for the internal PROM is achieved by using a general PROM programmer with the adaptor socket. The device selection (ROM Type) should be "27256" with following conditions.
 size : 256Kbit (32K x 8-bit) VPP: 12.5V TPW: 1ms
 Figure 3.2 shows the setting of pins in PROM mode.

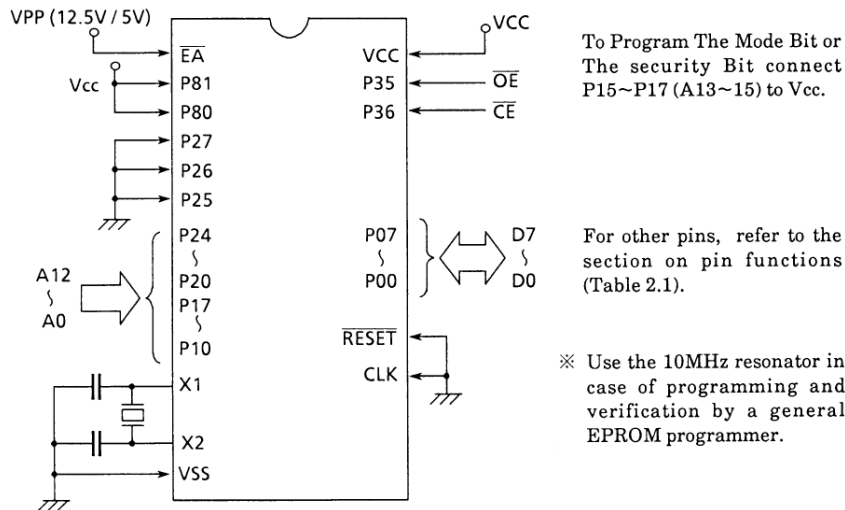

Figure 3.2. PROM Mode Pin Setting

(2) Programming Flow Chart

The programming mode is set by applying 12.5V (programming voltage) to the VPP pin when the following pins are set as follows,

- (Vcc : 6.0V) *These conditions can be
- ($\overline{\text{RESET}}$: "L" level) obtained by using adaptor
- (CLK : "L" level) socket.

After the address and data have been fixed, a data on the Data Bus is programmed when the $\overline{\text{CE}}$ pin is set to "Low" (1ms plus is required).

General Programming procedure of an EPROM programmer is as follows,

- Write a data to a specified address for 1ms.
- Verify the data. If the read-out data does not match the expected data, another writing is performed until the correct data is written (Max. 25 times).

After the correct data is written, an additional writing is performed by using three times longer programming pulse width (1ms x programming times), or using three times more programming pulse number. Then, verify the data and increment the address.

The verification for all data is done under the condition of Vpp = Vcc = 5V after all data were written.

Figure 3.3 shows the programming flow chart.

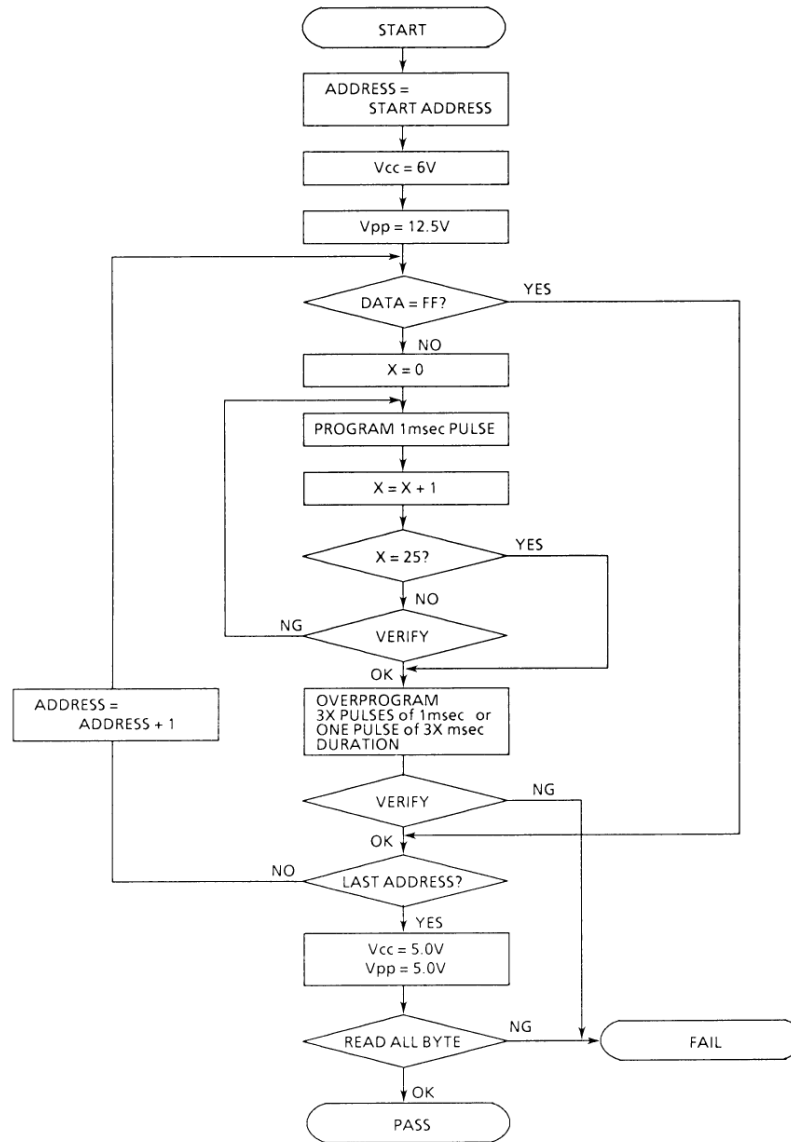

Figure 3.1. TMP90PH02 Memory Map

(3) The Security Bit

The TMP90PH02 has the Security Bit in PROM cell. If the Security Bit is programmed to “0”, the content of the PROM is disable to read in PROM mode.

How to Program the Security Bit.

- 1) Connect A15 pins to V_{CC}. [Otherwise connect them to GND to program PROM]
- 2) Set programming address to 0000H.
- 3) To program the Security Bit, set D0 to “0”.
- 4) Set D2 ~ D7 to “1” respectively.

The following table shows the 8-bit data to program The Security Bit.

Table 3.1 Data to Program

Bit to Program	D0 ~ D7	A0 ~ A13	A14, A15
The Security Bit	FEH	All “0”	A14 = “0” A15 = “1”
PROM (0000H ~ 3FFFH)	–	–	All “0”
